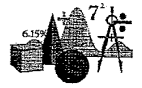
50 minutes + 2 minutes reading



Name SOLUTIONS

1. [2, 1, 2, 2 marks]

A winery produces a fine liquer which is predicted to increase in value by 4·8% p.a.

(a) How much will a bottle of liquer be worth in 2 years time, if it presently sells for $45?

$A = P(1+r)^n$
$= 45(1+0.048)^2 = 49.42$

(b) How much will a bottle of liquer be worth in n years time, if it presently sells for $45?

$A = 45(1.048)^n$

(c) The winemaker plans to release the liquer when it reaches a value of $100. How long will they have to wait for this to be the case?

100
$n = 17$ ✓

(d) Another red wine produced by the winery is increasing in value at 2·3% p.a. If a large flagon presently sells for $74, how long will it be before the Liquer becomes more expensive than the flagon?

$45(1.048)^n > 74(1.023)^n$
22 ✓

Sequences
$a_{n+1} = a_n \times 1.048 + 1$
$a_0 = 45$
$b_{n+1} = b_n \times 1.023 + 1$
$b_0 = 74$

2. [2, 1, 2, 2 marks]

Given $p(x) = 5x + 3$ and $q(x) = 2 - x$, find the following:

(a) the point of intersection of the two lines,

$5x - 3 = 2 - x$
$6x = 5$
$x = \frac{5}{6}$

20
$\left(\frac{5}{6}, \frac{7}{6}\right)$ ✓

(b) $p(4) = 23$

(c) $p(q(-1))$

$q(-1) = 2 - (-1)$
$= 3$

$p(3) = 5(3) + 3 = 18$ ✓

(d) the value of k for which $p(k) = -2$.

$5k + 3 = -2$
$5k = -5$
$k = -1$

3. [1, 1, 3 marks]

A function has a defining rule $y = 2x^2$

Determine the defining rule for the new function if the graph of this function is

(i) moved 2 units left, $y = 2(x+4)^2$

(ii) reflected in the y-axis, $y = 2(-x)^2$

(iii) reflected in the x-axis, then moved 3 units right and then 1 unit up.

$y = -2(x-3)^2 + 1$

4. [4 marks]

A cubic polynomial intersects the x-axis at x = -2, 3, 5.

Given that the graph goes through the point (4, 2) find the equation for the polynomial in the form, $y = ax^3 + bx^2 + cx + d$.

$(-2,0)$
$(3,0)$
$(5,0)$
$(4,2)$

$y = -\frac{1}{3}x^3 + 2x^2 + \frac{1}{3}x - 10$ ← stats cubic reg

$y = a(x+2)(x-3)(x-5)$

At $(4,2)$

$2 = a(4+2)(4-3)(4-5)$
$2 = a(6)(1)(-1)$
$2 = -6a$
$a = -\frac{2}{6}$
$= -\frac{1}{3}$

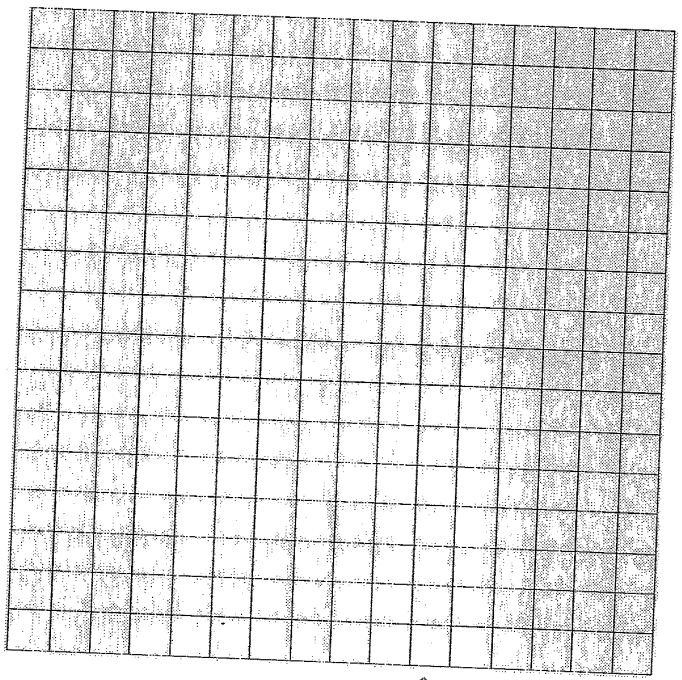
$y = -\frac{1}{3}(x+2)(x-3)(x-5)$
$= -\frac{1}{3}(x^2-x-6)(x-5)$

5. [6 marks]

With the aid of a graphic calculator produce a sketch of

$$y = x^3 - 3x^2 + 4$$

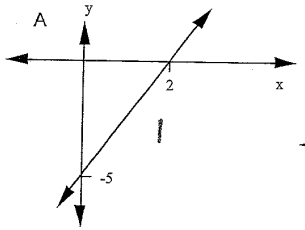
Indicate any turning points , intercepts with the axes and points of inflection. If any rounding is necessary give answers correct to 2 decimal places.



6. [2, 2, 2, 2, 2 marks]

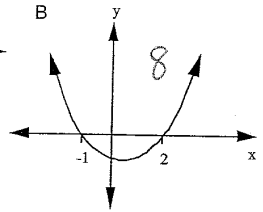
Match each of the graphs below with its corresponding function.
Choose from the functions listed below, where a, b, c, d and e are positive integers:

A



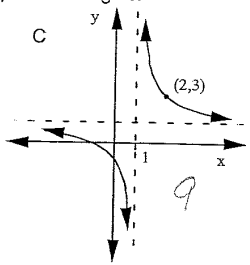
1

B



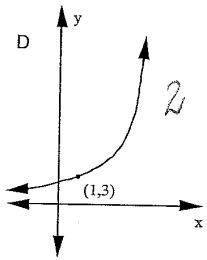
8

C



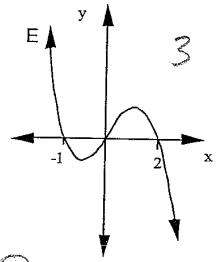
9

D



2

E



3

1. $y = ax - b$ ✓
2. $y = d^x + 1$
3. $y = -ax^3 + x^2 + dx$
4. ~~$y = x^3 - ax - b$~~
5. ~~$y = c^x - 1$~~
6. $y = \frac{1}{x+c}$
7. ~~$y = x^2 + x - e$~~
8. $y = x^2 - x - d$ ✓
9. $y = \frac{1}{x-b} + a$
10. ~~$y + ax = b$~~ $y = -ax + b$
11. ~~$y = \frac{1}{x-a}$~~
12. ~~$y = x + c$~~

$y = \frac{1}{x-1} + 1$

$y = (x+1)(x-2)$
$= x^2 - x - 2$

7. [2, 3, 3 marks]

State the domain and range for the following functions:

$x = \{2, 1, 0, -3, -2, 6\}$
$y = \{3, -9, 4, 5, 1\}$

(a) {(2, 3), (1, -9), (0, 4), (-3, 4), (-2, 5), (6, 1)}

(b) $y = x^2 + 4x + 3$

$x \in \mathbb{R}$

$\frac{b}{2a} = \frac{-4}{2} = -2$

$y = 4 - 8 + 3$
$= -1$

$y \geq -1$

(c) $y = \frac{1}{2x-3} + 1$

$x \in \mathbb{R}$ $x \neq \frac{3}{2}$

$y \in \mathbb{R}$, $y \neq +1$

8. [3 marks]

Given the graphs for $f(x) = ax^3 + bx^2 + cx + d$ and $g(x) = ex^2 + fx + g$,
for real constants a, b, ...,g, solve to 1 decimal place, the equation $f(x) = g(x)$.
