Mathematics
WACE written examination—2010 design brief
Stage 2

There will be two Mathematics examinations; one for Units 2A/2B, one for Units 2C/2D. This design brief is to be used for either Units 2A/2B or Units 2C/2D. These examinations will be scheduled at the same time and reflect the last pair of units completed within this course. The examinations comprise a calculator-free Section One and a calculator-assumed Section Two.

Time allowed

Reading time for Section One:	five minutes
Working time for Section One:	50 minutes
Changeover period—no student work:	approximately 15 minutes
Reading time for Section Two:	10 minutes
Working time for Section Two:	100 minutes

Permissible items

Section One:

Standard items: pens, pencils, pencil sharpener, highlighter, eraser

Section Two:

Standard items: pens, pencils, pencil sharpener, highlighter, eraser

Special materials: drawing instruments, ruler, templates, notes on up to two unfolded sheets of A4 paper, and up to two approved CAS calculators.

Additional information

Section One and Section Two are printed separately with a different coloured front cover. Section One has a perforated page of formulas particular to that examination, which is retained for possible use in Section Two. Calculator memory does not need to be cleared.

The marks assigned to content areas in the examination are within the following ranges:

Units	2A/2B	2C/2D
Content areas	**Weighting**	**Weighting**
Number and algebra	40–50%	45–55%
Space	20–25%	15–20%
Chance and data	30–35%	30–40%

These weightings apply to the whole examination rather than individual sections.

Instructions to candidates indicate that for any question or part question worth more than two marks valid working or justification is required to receive full marks.

Section	Supporting information
Section One **Calculator-free** 40 marks 5–10 questions with subparts Reading time: five minutes Suggested working time: 50 minutes	This section contains questions that examine procedures that can reasonably be expected to be completed without the use of a calculator**.** It comprises a variety of question types which require both open and closed responses. Open-ended questions typically call for high-level reasoning. Questions require candidates to demonstrate knowledge of mathematical facts, conceptual understandings, use of algorithms, use and knowledge of notation and terminology and problem solving skills. Selected questions could require students to investigate mathematical patterns, make and test conjectures and generalise and prove mathematical relationships. Questions may require the application of concepts and relationships to unfamiliar problem-solving situations, choose and use mathematical models with adaptations, compare solutions and present conclusions. Stimulus materials include diagrams, tables, graphs, drawings, print text and data gathered from the media and are organised around scenarios or concepts relevant to the units. Candidates' answers may include calculations, tables, graphs, and interpretation of data, descriptive answers, and conclusions.
