**Note: All part questions worth more than 2 marks require working to obtain full marks.**

Q1 (1 & 2 = 3 marks)

Express each of the following in the form  $a + bi$  where  $a$  &  $b$  are real numbers.

a)  $(3 - 4i)(5i)$

b)  $\frac{2 - 3i}{5 + i}$

Q2 (3 marks)

Determine the remainder when  $3x^2 - 5x + 7$  is divided by  $(x + 3 - 2i)$

Q3 (3 marks)

Determine the complex number  $q$  in polar form.

Q4 (2 &amp; 3 = 5 marks)

Sketch the following in the complex plane showing all major features.

a)  $\arg(z) = \frac{2\pi}{3}$

b)  $|z + 3 - 4i| = 6$

Q5 (2, 3 & 3 = 8 marks)

If  $z = a + ib$  and  $w = p + iq$  where  $a, b, p$  &  $q$  are real numbers, show the following:

a)  $\overline{z + w} = \overline{z} + \overline{w}$

b)  $\overline{zw} = \overline{z} \overline{w}$

- c) Hence or otherwise show that if there is a complex root to the quadratic equation  $ax^2 + bx + c = 0$  with real coefficients, then the conjugate is also a root.  
(Hint: Take the conjugate of both sides of the quadratic equation)

Q6 (4 marks)

Consider the set of complex numbers  $z = x + iy$  that satisfy the following equation:  
 $|z + 1 - i| = |z - 3 - 7i|$ .

Determine the cartesian equation, in terms of  $x$  &  $y$ , of these numbers.

Q7 (2 & 4 = 6 marks)

Consider the function  $f(z) = az^3 + bz^2 + cz + d$  where  $a, b, c$  &  $d$  are real constants.

It is known that  $(z - 1)$  is a factor, and  $f(0) = -18$  &  $f(3i) = 0$ .

a) Determine all three factors of  $f(z)$ .

b) Determine the values of  $a, b, c$  &  $d$ .

Q8 (4 & 1 = 5 marks)

Consider the set of complex numbers,  $z$ , that satisfy the following:

$$\left| z - 2\sqrt{2} - 2\sqrt{2}i \right| \leq c, \quad c \geq 0 \text{ a real constant, and } 0 < \text{Arg}(z) < \frac{\pi}{2}.$$

Determine:

- a) The value of  $c$  given that the Maximum value of  $\text{Arg}(z) = \frac{5\pi}{12}$ .

- b) Maximum value of  $|z|$ .
