

## Worksheet 6.3: Solutions

### The Haber process

No.	Answer
1	$\text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightleftharpoons 2\text{NH}_3(\text{g}) ; \Delta H = -92.3 \text{ kJ}$
2	<p>Steam and methane are heated with air to high temperatures (between 700°C and 1100°C) and pressures (25–35 atm) in the presence of a nickel catalyst to produce carbon monoxide and hydrogen gas. The carbon monoxide formed is then reacted with more steam to produce carbon dioxide and more hydrogen gas:</p> $\text{CH}_4(\text{g}) + \text{H}_2\text{O}(\text{g}) \rightleftharpoons \text{CO}(\text{g}) + 3\text{H}_2(\text{g})$ $\text{CO}(\text{g}) + \text{H}_2\text{O}(\text{g}) \rightleftharpoons \text{CO}_2(\text{g}) + \text{H}_2(\text{g})$ <p>The carbon dioxide gas is absorbed by a suitable base, leaving a mixture of hydrogen and nitrogen (from the air) in the mole ratio 3:1.</p>
3	Increased pressure, increased temperature, use of a catalyst and increased concentration of reactants would all increase its rate.
4	Increased pressure, decreased temperature, increased concentration of reactants and decreased concentration of product would increase its yield.
5	There is a temperature conflict. It is resolved by using a ‘compromise’ temperature of 450°C, which allows a satisfactory rate of reaction without compromising the yield too much. A catalyst is also used.
6	<p><b>a</b> Porous iron pellets with <math>\text{Al}_2\text{O}_3</math> and KOH are used the catalyst.</p> <p><b>b</b> It is a heterogeneous catalyst – the catalyst is solid but the reactants are gaseous.</p>
7	They lower the activation energy by providing an alternative reaction pathway.
8	A similar profile to the one shown in Figure 6.6 on page 159 of the textbook.
9	<p><b>a</b> <math>n(\text{N}_2) = \frac{m}{M} = \frac{300\,000}{28.02} = 1.071 \times 10^4 \text{ mol}</math></p> <p><math>n(\text{NH}_3) = 2 \times n(\text{N}_2) = 1.071 \times 10^4 \times 2 = 2.142 \times 10^4 \text{ mol}</math></p> <p><math>m(\text{NH}_3) = n \times M = 2.142 \times 10^4 \times 17.034 = 3.65 \times 10^5 \text{ g}</math></p> <p><b>b</b> <math>n(\text{NH}_3) = \frac{m}{M} = \frac{5.68 \times 10^6}{17.034} = 3.335 \times 10^5 \text{ mol}</math></p> <p><math>n(\text{N}_2) = \frac{1}{2} \times n(\text{NH}_3) = \frac{1}{2} \times 3.335 \times 10^5 = 1.668 \times 10^5 \text{ mol}</math></p> <p><math>m(\text{N}_2) = 1.668 \times 10^5 \times 28.02 = 4.67 \times 10^6 \text{ g}</math></p>
10	Oxidation number of N in $\text{N}_2$ is 0, while in $\text{NH}_3$ it is –3. A decrease in oxidation number is reduction.
11	See Figure 6.26 on page 188 of the textbook.
