

# Australian Islamic College 2019

## ATAR Chemistry Units 3 and 4

### Task 11 (Weighting: 5%)

#### Esters Validation Test

Test Time: 45 minutes

Please do not turn this page until instructed to do so.

First Name	Surname

Teacher

Mark / 42	Percentage

Equipment allowed: Pens, pencils, erasers, whiteout, correction tape, rulers and non-programmable calculators permitted by the Schools Curriculum and Standards Authority.

## **Special conditions:**

2 marks will be deducted for failing to write your full name on this test paper.

**Teacher help:** Your teacher can only help you during your test in one situation.

If you believe there is a mistake in a question show your teacher and your teacher will tell you if there is a mistake in the question and if appropriate, how to fix that mistake.

**Spelling of Science words** must be correct. Science words with more than one letter wrong (wrong letter and/or wrong place) will be marked wrong.

**Equations** must be written balanced and with correct state symbols or they will be marked wrong.

Questions must be answered in this booklet.

Total marks: 42

**PART ONE: MULTIPLE CHOICE QUESTIONS****(3 MARKS)****Circle the correct answer on this page.**

1. A food chemist wishes to create the odour of pineapples for a product. An ester with this odour has the formula:  $\text{CH}_3\text{CH}_2\text{OOCCH}_2\text{CH}_3$ . Which of the following pairs of reactants with the aid of a suitable catalyst would produce this ester?
- $\text{CH}_3\text{CH}_2\text{COOH}$  and  $\text{CH}_3\text{COOH}$
  - $\text{CH}_3\text{COOH}$  and  $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$
  - $\text{CH}_3\text{CH}_2\text{COOH}$  and  $\text{CH}_3\text{CH}_2\text{OH}$
  - $\text{CH}_3\text{CH}_2\text{OH}$  and  $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$
2. An organic substance has an empirical formula of  $\text{C}_3\text{H}_6\text{O}_2$ . Which of the following is NOT a possible identity of the substance?
- Propanoic acid
  - Ethyl methanoate
  - Methyl methanoate
  - Methyl ethanoate
3. The following two organic substances were reacted together under favourable conditions and a new product was formed.

Which one of the following could be produced from this reaction?

- A protein
- A fatty acid
- A soap
- A polyester

**END OF MULTIPLE CHOICE SECTION**

**PART TWO: SHORT ANSWER QUESTIONS****(39 marks)**

1. These two molecules are salicylic acid (left) and methyl salicylate (right).

- a. Which molecule is likely to have the greatest dispersion forces? Justify your answer. (1 mark for both correct molecule and correct explanation; no part marks). (1 mark)
- b. Salicylic acid is a solid at room temperature whereas methyl salicylate is a liquid. Explain this in terms of intermolecular forces. (2 marks)
- c. Draw structural formulae to show the esterification reaction that produced methyl salicylate. State symbols, reaction conditions and the catalyst do not need to be specified at this point. Hydrogen atoms bonded to carbon atoms do not need to be drawn. (2 marks)

d. Name the other reactant, other than salicylic acid, in the esterification reaction that produces methyl salicylate.

(1 mark)

e. Concentrated sulfuric acid is added to the reaction when an ester is made. List two functions served by the presence of the concentrated sulfuric acid.

(2 marks)

2. On the video, concentrated sulfuric acid was removed by reaction with dilute sodium carbonate solution. Write the ionic equation for this reaction.

(1 mark)

3. List two safety precautions that were seen being used in the video while esters were being synthesised. For each, describe the/a safety hazard that requires the use of that safety precaution.

(2 marks)

4. Draw a full structural formula, including all bonds and all hydrogen atoms, for the ester that forms from the reaction between methanol and butanoic acid. Also name this ester.

(2 marks)

5. Lactic acid was first isolated from a sample of milk in 1780. It is often known as 'milk acid' due to its association with this substance. It is also produced in the human body during exercise, and can be used in medicine as a component of a solution to replace fluids after blood loss or surgery. Lactic acid is a weak, monoprotic acid with the following structure;

When lactic acid is mixed with butan-2-ol, in the presence of an appropriate catalyst and heat, an esterification reaction takes place.

- a. Draw the structure of the ester formed in this reaction.

(1 mark)

- b. Write a molecular equation for the esterification reaction taking place.

(1 mark)

- c. What would be the most noticeable observation for this reaction?

(1 mark)

6. Stearic acid (IUPAC name octadecanoic acid) is a fatty acid (a long chain carboxylic acid) with the condensed structural formula  $\text{CH}_3(\text{CH}_2)_{16}\text{COOH}$ .

Three molecules of stearic acid can be reacted with one molecule of another substance to make a triglyceride called stearin.

- a. Name the other substance referred to above, that will react with three molecules of stearic acid to make stearin.

(1 mark)

- b. Use condensed structural formulae to show the formation of stearin from three molecules of stearic acid and one molecule of another substance. Be sure to show all reactant/s and all product/s.

(2 marks)

- c. What functional group/s are present in each of these?

(2 marks)

- i. Stearic acid

- ii. Tristearin

- d. Describe the differences in the intermolecular forces that are present in stearic acid and tristearin. Also describe the reasons for these differences by referring to specific structures within the molecules.

(5 marks)

- e. Tristearin can be reacted with another substance to make soap.

i. Name a substance that will react with tristearin to make soap.

(1 mark)

ii. Name the type of reaction that will produce soap from tristearin.

(1 mark)

- f. Use condensed structural formulae to show the reaction that produces soap from tristearin. Balance the equation.

(2 marks)

- g. Write a suitable reaction that demonstrates why a soap made from tristearin cannot be used in hard water. Balance the equation.

(2 marks)

- h. One advantage of detergents over soaps is that they can be used in hard water.  
List two other differences between soaps and detergents.

(2 marks)

- i. Describe how the shape of a soap molecule allows it to clean grease off a dirty plate.

(5 marks)

**END OF TEST**

**Blank Page For Student Use. This Page Will Not Be Marked.**
