## Mathematics Specialist

## Year 11

Student name: \_\_\_\_\_ Teacher name: \_\_\_\_\_

Date: Friday 23<sup>rd</sup> July 2021

<b>Task type:</b>	<b>Response</b>
<b>Time allowed:</b>	<b>45 minutes</b>
<b>Number of questions:</b>	<b>6</b>
<b>Materials required:</b>	Calculator with CAS capability (to be provided by the student)
<b>Standard items:</b>	Pens (blue/black preferred), pencils (including coloured), sharpener, correction fluid/tape, eraser, ruler, highlighters
<b>Special items:</b> -	Drawing instruments, templates, notes on two unfolded sheets of A4 paper, and up to three calculators approved for use in the WACE examinations
<b>Marks available:</b>	<b>40 marks</b>
<b>Task weighting:</b>	<b>10%</b>

**Formula sheet provided: Yes**

**Note: All part questions worth more than 2 marks require working to obtain full marks.**

1. [7 marks]

Use mathematical induction to prove that

$$3 \times 5 + 6 \times 6 + 9 \times 7 + \dots + 3n(n+4) = \frac{n(n+1)(2n+13)}{2}$$

for all positive integers  $n$ .

#### Solution

Let  $P(n)$  denote the proposition ' $3 \times 5 + 6 \times 6 + 9 \times 7 + \dots + 3n(n+4) = \frac{n(n+1)(2n+13)}{2}$ ', for all positive integers  $n$ .

With  $n=1$ ,

$$LHS \text{ of } P(1) = 3 \times 5 = 15$$

$$RHS \text{ of } P(1) = \frac{1(1+1)(2 \times 1 + 13)}{2} = 15$$

Hence LHS=RHS, and so  $P(1)$  is true.

Now assume that  $P(k)$  is true for some positive integer  $k$ . Then

$$3 \times 5 + 6 \times 6 + 9 \times 7 + \dots + 3k(k+4) = \frac{k(k+1)(2k+13)}{2}.$$

Now

$$\begin{aligned} LHS \text{ of } P(k+1) &= 3 \times 5 + 6 \times 6 + 9 \times 7 + \dots + 3k(k+4) + 3(k+1)((k+1)+4) \\ &= \frac{k(k+1)(2k+13)}{2} + 3(k+1)((k+1)+4) \\ &= \frac{k(k+1)(2k+13)}{2} + \frac{6(k+1)(k+5)}{2} \\ &= \frac{k(k+1)(2k+13) + 6(k+1)(k+5)}{2} \\ &= \frac{(k+1)[k(2k+13) + 6(k+5)]}{2} \\ &= \frac{(k+1)(2k^2 + 19k + 30)}{2} \\ &= \frac{(k+1)(k+2)(2k+15)}{2} \\ &= \frac{(k+1)((k+1)+1)(2(k+1)+13)}{2} = RHS \text{ of } P(k+1) \end{aligned}$$

Hence  $P(k+1)$  is true.

We have shown that  $P(1)$  is true, and that if  $P(k)$  is true for some positive integer  $n$  then  $P(k+1)$  is also true. Hence, by the principle of mathematical induction,  $P(n)$  is true for all positive integers  $n$ .

#### Specific behaviours

- ✓ proves  $P(1)$  by evaluating LHS and RHS separately
- ✓ assumes  $P(k)$  is true
- ✓ writes LHS of  $P(k+1)$  using RHS of  $P(k)$
- ✓ simplifies expression algebraically to one fraction
- ✓ writes numerator with a factor of  $(k+1)$
- ✓ obtains expression for RHS of  $P(k+1)$  written in terms of  $k+1$

✓ writes conclusion for whole proof (accept just the second sentence without the first)

2. [2 marks]

A question in a Specialist exam paper asked students to prove the following statement:

' $3n$  is odd if and only if  $n$  is odd (where  $n$  is an integer)'.

One student wrote the answer below. Explain clearly why they should **not** receive full marks for this answer.

*Proof:*

*We prove the contrapositive. Assume that  $n$  is an even integer. Then  $n = 2k$  for some integer  $k$ . Now*

$$3n = 3(2k) = 2(3k)$$

*which is even since  $3k$  is an integer. Hence if  $n$  is even then  $3n$  is even, which implies that  $3n$  is odd if and only if  $n$  is odd.*

Solution
The student has proved only the statement 'if $3n$ is odd then $n$ is odd'. However, since the original statement involves the phrase 'if and only if', it is also necessary to prove the statement 'if $n$ is odd then $3n$ is odd'.
Specific behaviours
<ul style="list-style-type: none"> <li>✓ Notes that statement involves 'if and only if', or describes as an equivalence statement</li> <li>✓ Explains that the student should also have proved that 'if <math>n</math> is odd then <math>3n</math> is odd', or refers to the 'backward direction'</li> </ul>

3. [9 = 3+3+3 marks]

Write whether each of the following statements is true or false, and prove or disprove it accordingly.

a) For all positive real numbers  $x$

$$x^3 - x \geq x^2 - x$$

Solution
<p>The statement is <b>false</b>, and is disproved with the following counterexample:</p> <p>Let <math>x = \frac{1}{2}</math>. Then <math>\text{LHS} = \frac{1}{8} - \frac{1}{2} = \frac{-3}{8}</math> and <math>\text{RHS} = \frac{1}{4} - \frac{1}{2} = \frac{-1}{4}</math>, meaning that <math>x^3 - x &lt; x^2 - x</math> in this case.</p>

Hence the statement is false.
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ states false</li> <li>✓ states counterexample with a particular value of <math>x</math></li> <li>✓ shows that for that value of <math>x</math>, <math>x^3 - x &lt; x^2 - x</math>.</li> </ul> <p>[Alternatively give 2<sup>nd</sup> and 3<sup>rd</sup> marks if successfully argues false for any value of <math>x</math> with <math>0 &lt; x &lt; 1</math>.]</p>

- b) There exist distinct prime numbers  $p$  and  $q$  such that  $p - q = 2$ .

<b>Solution</b>
<p>The statement is <b>true</b>, and is proved with the following example:</p> <p>Let <math>p = 5</math> and <math>q = 3</math>. Then <math>p - q = 2</math>.</p>
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ states true</li> <li>✓✓ states example with values of <math>p</math> and <math>q</math> such that <math>p - q = 2</math></li> </ul>

- c) There exist distinct prime numbers  $p$  and  $q$  such that  $p^2 - q^2 = 2$ .

<b>Solution</b>
<p>The statement is <b>false</b>.</p> <p>Let <math>p</math> and <math>q</math> be distinct prime numbers. Then</p> $p^2 - q^2 = (p + q)(p - q)$ <p>Since <math>p</math> and <math>q</math> are distinct primes, <math>p + q \geq 5</math> and <math>p - q \geq 1</math>, and so</p> $p^2 - q^2 \geq 5.$ <p>Hence there do not exist distinct prime numbers <math>p</math> and <math>q</math> with <math>p^2 - q^2 = 2</math>.</p>
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ states false</li> <li>✓ factorises <math>p^2 - q^2</math> using difference of squares</li> <li>✓ argues that <math>p^2 - q^2</math> cannot equal 2.</li> </ul>

4. [6 marks]

Find the values of  $x$ ,  $y$  and  $z$  in each of the following:

- a)  $A, B, C$  and  $D$  all lie on the circle with centre  $O$ :

Solution
$5x + x = 180$ $x = 30$
$z = 2 \times 30 = 60$
$y = 360 - 60 = 300$
Specific behaviours
✓✓✓ 1 mark per correct value

- b)  $\overline{RS}$  is tangent to the circle with centre  $O$ .

Solution
$x = 2 \times 30 = 60$
$y = 30$
$z = 180 - 90 - 60 = 30$
Specific behaviours

✓✓✓ 1 mark per correct value

5. [5 marks]

$ABCD$  is a quadrilateral such that each of the four sides is tangent to the same circle, at the points  $P, Q, R$  and  $S$ , as illustrated below. If  $AB=15$ ,  $BC=10$  and  $CD=12$ , find the length  $AD$ .

#### Solution

Since the sides are tangent to the circle, we may write:

$w = AS = AP$ ,  $x = BQ = BP$ ,  $y = CQ = CR$  and  $z = DS = DR$ .

Thus

$$w + x = 15 \quad (1)$$

$$x + y = 10 \quad (2)$$

$$y + z = 12 \quad (3)$$

Adding equations (1) and (3) gives

$$w + x + y + z = 27$$

and subtracting equation (2) gives

$$w + z = 17$$

Hence  $AD = 17$ .

#### Specific behaviours

- ✓ uses theorem for tangent segments from the same point
- ✓ identifies segments of equal lengths
- ✓ sets up equations for side lengths using sums of segment lengths
- ✓ solves set of equations for  $w + z$
- ✓ states correct value

[Accept alternative methods.]

6. [11 = 3+4+4 marks]

Solve each of the following trigonometric equations for  $x$  in the stated domain.

**Show all working to support your answers.**

a)  $2 \cos(x) = \sqrt{3}$  for  $0 \leq x \leq 2\pi$

#### Solution

$2 \cos(x) = \sqrt{3} \cos(x) = \frac{\sqrt{3}}{2} x = \frac{\pi}{6} \vee \frac{11\pi}{6}$
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ isolates <math>\cos(x)</math></li> <li>✓ states at least one correct solution</li> <li>✓ states two correct solutions</li> </ul> [No marks for answers only]

b)  $\sin\left(x + \frac{\pi}{4}\right) = \frac{-1}{\sqrt{2}}$  for  $-\pi \leq x \leq \pi$

<b>Solution</b>
$\sin\left(x + \frac{\pi}{4}\right) = \frac{-1}{\sqrt{2}} \Rightarrow x + \frac{\pi}{4} = \frac{5\pi}{4} + k2\pi \text{ or } x + \frac{\pi}{4} = \frac{7\pi}{4} + k2\pi$ <p>Hence</p> $x = \pi + k2\pi$ $\text{or } x = \frac{3\pi}{2} + k2\pi$ <p>With <math>k=0</math>, <math>x = \pi</math> or <math>x = \frac{3\pi}{2}</math></p> <p>With <math>k=-1</math>, <math>x = -\pi</math> or <math>x = -\frac{\pi}{2}</math></p> <p>Hence <math>x = -\pi, -\frac{\pi}{2}</math> or <math>\pi</math></p>
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ isolates <math>\sin\left(x + \frac{\pi}{4}\right)</math></li> <li>✓ states at least one correct solution for <math>x + \frac{\pi}{4}</math></li> <li>✓ states at least one correct solution for <math>x</math></li> <li>✓ states all three correct solutions for <math>x</math></li> </ul> [No marks for answers only]

c)  $\frac{1}{\sqrt{3}} \tan(5x) = 1$  for  $0 \leq x \leq \pi$

<b>Solution</b>
$\tan(5x) = \sqrt{3} \Rightarrow 5x = \frac{\pi}{3} + k\pi \Rightarrow x = \frac{\pi}{15} + k\frac{\pi}{5}$

Letting  $k=0,1,2,3$  and  $4$  we obtain:

$$x = \frac{\pi}{15}, \frac{4\pi}{15}, \frac{7\pi}{15}, \frac{10\pi}{15} \text{ and } \frac{13\pi}{15}$$

#### Specific behaviours

✓ isolates  $\tan(5x)$

✓ obtains  $\frac{\pi}{3}$  as a solution for  $5x$

✓ obtains  $\frac{\pi}{15}$  as a solution for  $x$

✓ states all five correct solutions for  $x$

[No marks for answers only]
