Since one of the direction vectors of the plane is the same as the direction vector of the line, the line is either parallel to the plane or contained IN the plane. ✓

Need to determine if the point P(2, 0, 1) belongs to the plane.

Plane:

$$r = \begin{pmatrix} 1 \\ 1 \\ 2 \end{pmatrix} + s \begin{pmatrix} -1 \\ 1 \\ -1 \end{pmatrix} + t \begin{pmatrix} -3 \\ 2 \\ 0 \end{pmatrix}$$

$$x = 1 - s - 3t, \quad y = 1 + s + 2t, \quad z = 2 - s$$

$$\text{If } z = 1 \quad 1 = 2 - s$$

$$s = 1$$

$$\Rightarrow x = -3t \text{ and } y = 2 + 2t$$

$$\text{If } x = 2, \text{ then } t = -\frac{2}{3} \Rightarrow y = 2 + 2\left(-\frac{2}{3}\right) = 2 - \frac{4}{3}$$

$$y = \frac{2}{3}$$

But $y = 0$

Therefore the point does NOT belong to the plane.

Therefore the line is parallel to the plane.

$A(12, 0, 0)$ so $12a = d$

$B(0, 4, 0)$ so $4b = d$

$C(0, 0, 4)$ so $4c = d$

$$\sigma_{\bar{x}} \approx 6.12$$

- (ii) When a sample is taken, the range is usually smaller as it does not usually contain any outliers (which are rare scores).
Most apples would be close to the mean weight, and it is unlikely to select an unusually big or small apple in a small sample, so a sample of 6 would have a small standard deviation.

$$= 160 \pm 13.15$$

$$146.85 \leq \mu \leq 173.15$$

(c) To be 90% sure the confidence limits are correct, you can have a smaller range as there is a 10% error margin.

To be surer, i.e. a 95% confidence limit then you have a wider range so there is a bigger chance that the mean will be included. ✓✓
