

Note: All part questions worth more than 2 marks require working to obtain full marks.

Formula sheet provided: Yes

Task weighting: 10%

Marks available: 46 marks

Examinations

A4 paper, and up to three calculators approved for use in the WACE

Special items:

Drawing instruments, templates, notes on one unfolded sheet of

correction fluid/tape, eraser, ruler, highlighters

Pens (blue/black preferred), pencils (including coloured), sharpener,

Materials required: Calculator with CAS capability (to be provided by the student)

Number of questions: 9

Time allowed for this task: 45 mins

Task type: Response

Date:

Student name: \_\_\_\_\_ Teacher name: \_\_\_\_\_

Course Methods Test 3 Year 12

Q1 (3.1.6) (3 & 3 = 6 marks)  
Determine the exact gradient of each of the following at the given point. Show all working.

a)  $y = \cos 3x$  at the point  $\left(\frac{\pi}{3}, -1\right)$

<b>Solution</b>
$y' = -3\sin 3x$
$= 0$
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ diff</li> <li>✓ subs x value</li> <li>✓ obtains derivative</li> </ul>

b)  $y = 5\cos^2 x$  at the point  $\left(\frac{\pi}{6}, \frac{15}{4}\right)$

<b>Solution</b>
$y' = 10\cos x(-\sin x)$
$= 10\left(\frac{\sqrt{3}}{2}\right)\left(-\frac{1}{2}\right) = -\frac{5\sqrt{3}}{2}$
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ diff</li> <li>✓ subs x value</li> <li>✓ obtains derivative</li> </ul>

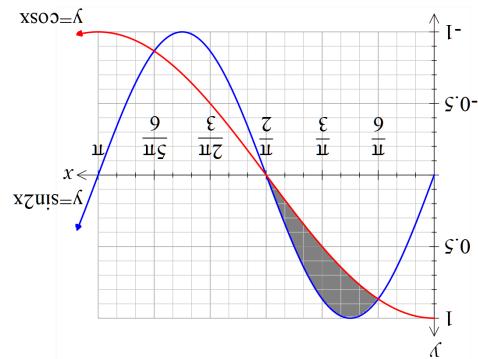

Q9 (4.1.11/3.2.16) (3 & 4 = 7 marks)  
This question must be answered without the use of a classpad to receive full marks.

a)  $\frac{d}{dx} |(x+1)\ln(1+x)|$  (Simplify)

<b>Solution</b>
$\frac{d}{dx}  (x+1)\ln(1+x)  = (x+1)\frac{1}{1+x} + \ln(1+x) = 1 + \ln(1+x)$
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ uses product rule</li> <li>✓ diff log term</li> <li>✓ obtains simplified expression</li> </ul>

b) Use the result from (a) above to determine  $\int_1^4 \ln(1+x) dx$  in exact simplified form.

<b>Solution</b>
$\int \frac{d}{dx}  (x+1)\ln(1+x)  dx = \int 1 + \ln(1+x) dx$
$(x+1)\ln(1+x) = x + \int \ln(1+x) dx$
$\int \ln(1+x) dx = (x+1)\ln(1+x) - x$
$\int_1^4 \ln(1+x) dx = \left[(x+1)\ln(1+x) - x\right]_1^4 = (4\ln 4 - 3) - (3\ln 3 - 2)$
$= \ln 4^4 - \ln 3^3 - 1$
$= \ln\left(\frac{4^4}{3^3}\right) - 1 = \ln\left(\frac{4^4}{3^3}\right) - \ln e$
$= \ln\left(\frac{4^4}{3^3 e}\right)$
<b>Specific behaviours</b>
<ul style="list-style-type: none"> <li>✓ uses linearity principle (first line)</li> <li>✓ uses fundamental theorem</li> <li>✓ obtains antiderivative and subs correct limits</li> </ul>

**Specific behaviours**

- ✓ sets up integral
- ✓ uses correct limits
- ✓ shows anti-derivatives
- ✓ determines area

$$\begin{aligned}
 &= \frac{1}{4} \\
 &= \left[ \frac{1}{2}x - \frac{1}{4}\sin 2x \right]_0^{\frac{\pi}{2}} \\
 &= \left[ \frac{1}{2}\cos 2x - \sin x \right]_0^{\frac{\pi}{2}}
 \end{aligned}$$

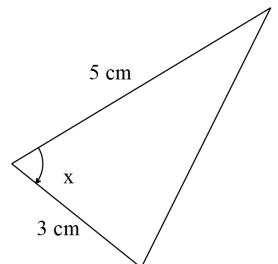

$$\int_{\frac{\pi}{2}}^0 \sin 2x - \cos x \, dx$$

**Solution**

Determine the exact area shaded in the diagram below without the use of a classpad.  
(4 marks)

Q3 (3.1.6/3.1.10)

Consider the triangle drawn below with angle  $x$  radians and fixed length sides 5 & 3 cm. Let  $A$  represent the area of the triangle in  $\text{cm}^2$ .

- a) Determine  $\frac{dA}{dx}$  when  $x = \frac{\pi}{4}$ .

**Solution**

$$A = \frac{1}{2}(15)\sin x$$

$$\frac{dA}{dx} = \frac{15}{2}\cos x$$

$$= \frac{15}{2} \left( \frac{1}{\sqrt{2}} \right) \text{ or } \frac{15\sqrt{2}}{4} \text{ cm}^2$$

**Specific behaviours**

- ✓ uses area formula
- ✓ states derivative
- ✓ subs to find exact value or approx

- b) Using the increments formula, determine the approximate change in the area when the angle

changes from  $\frac{\pi}{4}$  to  $\frac{\pi}{4} + 0.01$  radians.

**Solution**

$$\Delta A \approx \frac{dA}{dx} \Delta x$$

$$= \frac{15}{2} \left( \frac{1}{\sqrt{2}} \right) 0.01 \approx 0.053$$

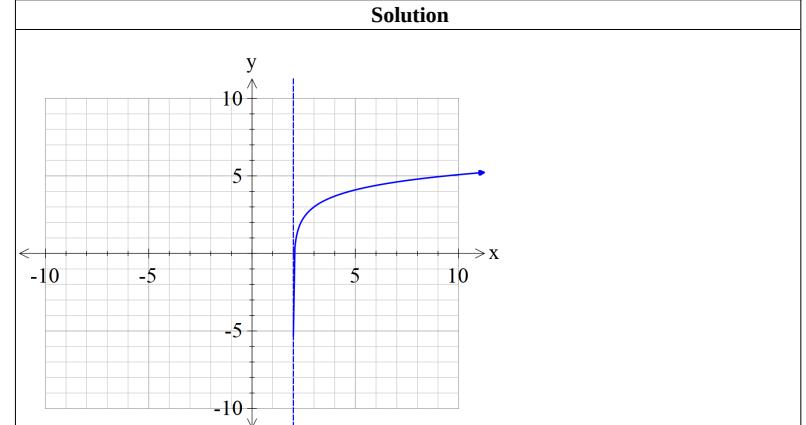

(3 &amp; 3 = 6 marks)

Q8 (4.1.6)

(3 &amp; 3 = 6 marks)

Consider the function  $f(x) = \ln(x - 2) + 3$ 

- a) Sketch the function on the axes below showing all major features.

**Solution****Specific behaviours**

- ✓ asymptote
- ✓ shape
- ✓ y less than 6 at x=10

- b) In terms of the constants  $p$  &  $q$ , determine the  $x$  intercept of the function  $f(x+2p) - q$ .

**Solution**

$$f(x) = \ln(x - 2) + 3$$

$$f(x+2p) - q = \ln(x+2p - 2) + 3 - q$$

$$0 = \ln(x+2p - 2) + 3 - q$$

$$q - 3 = \ln(x+2p - 2)$$

$$x+2p - 2 = e^{q-3}$$

$$x = e^{q-3} + 2 - 2p$$

**Specific behaviours**

- ✓ replaces x with x+2p
- ✓ rearranges to an exponential equation
- ✓ obtains expression for x

The following questions require full working and answers only given by the classpad will not receive full marks.

$s(t) = 55 + t \ln(3t^2)$

The displacement of a car moving in straight line is given by  $s(t)$  km at  $t$  hours, where  $3 \leq t \leq 6$  marks)

(Q7 (4.1.11))

**Specific behaviours**

- uses increments formula
- simplifies values
- determines approximation
- changes units

(Q4 (3.3.1))

The expected value of the discrete probability distribution,  $X$ , given below, is  $\frac{3}{2}$ . Determine the values of the constants  $p \neq q$  and the variance of  $X$  to 3 decimal places.

$x$	$p(X=x)$	1	0.1	2	$p$	3	0.1	4	q	0.3
2										
3										
4										
5										

(Q4 (3.3.1))

**Solution**

$p+q=0.5$

$\frac{11}{3}=2p+4q+1.9$

$p,q$

$\left\{ \begin{array}{l} p=\frac{7}{60}, q=\frac{23}{60} \\ p+q=0.5 \end{array} \right.$

**Specific behaviours**

- solves one equation with  $p \neq q$
- states second equation with  $p \neq q$
- solves for  $p, q$
- states variance to 3 dp

**Variance = 1.655**

(Q4 (3.3.1))

**Solution**

$a = \frac{2}{t} = 0.2$

$t = 10$

$v = 2 + \ln(3t^2) = 2 + \ln 31 + 2 \ln 10$

**Specific behaviours**

- sets up equation
- solves for  $t$
- shows how to diff velocity

(d) Determine the time that the acceleration will be  $0.2 \text{ km/h}^2$ .

(Q4 (3.3.1))

**Solution**

$\frac{ds}{dt} = t \frac{62t}{1519} + \ln(3t^2)$

$= 2 + \ln \left( \frac{1519}{4} \right) \approx 7.9$

**Specific behaviours**

- uses product rule
- diff log term
- obtains speed

(a) Determine the velocity at  $t = 3.5$  hours.

(Q7 (4.1.11))

**Perth Modern**

Mathematics Department

The following questions require full working and answers only given by the classpad will not receive full marks.

$s(t) = 55 + t \ln(3t^2)$

The displacement of a car moving in straight line is given by  $s(t)$  km at  $t$  hours, where  $3 \leq t \leq 6$  marks)

(Q7 (4.1.11))

**Perth Modern**

Mathematics Department

- Q5 (3.3.13) (3 marks)  
 A binomial distribution has a mean of 6 and a standard deviation pf 1.9. Determine the values of  $n$  &  $p$ , the number of trials and the probability of a success.

solves for second constant

**Solution**

$$\begin{cases} 6=np \\ 1.9=\sqrt{np(1-p)} \end{cases} \quad |_{n, p}$$

{n=15.01504007, p=0.3995993333}

n = 15 & p=0.4

**Specific behaviours**

- ✓ states two equations for n and p
- ✓ solves approx. values
- ✓ rounds n to an integer

- Q6 (3.3.7) (4 marks)  
 A teacher needs to scale the results of her class by first multiplying by a constant and then adding a second constant. The original mean was 72 with a standard deviation of 21, the teacher needs the scaled results to have a mean of 60 and a standard deviation of 15. Determine the values of  $a$  &  $b$ .

**Solution**

Edit Action Interactive

0.5 1  $\frac{1}{2}$   $\frac{1}{\sqrt{2}}$   $\frac{1}{\sqrt[3]{2}}$   $\frac{1}{\sqrt[4]{2}}$   $\frac{1}{\sqrt[5]{2}}$   $\frac{1}{\sqrt[6]{2}}$   $\frac{1}{\sqrt[7]{2}}$   $\frac{1}{\sqrt[8]{2}}$   $\frac{1}{\sqrt[9]{2}}$   $\frac{1}{\sqrt[10]{2}}$

solve( $15=a \cdot 21$ , a)

$$\left\{ a = \frac{5}{7} \right\}$$

solve( $72 \cdot a + b = 60 \mid \left\{ a = \frac{5}{7} \right\}$ , b)

$$\left\{ b = \frac{60}{7} \right\}$$

**Specific behaviours**

- ✓ states one equation with constant
- ✓ states two equations with constants
- ✓ solves for one constant
