A random variable X is normally distributed such that the mean is twice the variance and the probability that X is greater than 21.5 is 0.231. Find the mean and standard deviation of X .

Instructions to candidates

- The rules for the conduct of Western Australian external examinations are detailed in the *Year 12 Information Handbook 2010*. Sitting this examination implies that you agree to abide by these rules.
- Write your answers in the spaces provided in this Question/Answer Booklet. Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.
 - Planning: If you use the spare pages for planning, indicate this clearly at the top of the page.
 - Continuing an answer: If you need to use the space to continue an answer, indicate in the original answer space where the answer is continued, i.e. give the page number. Fill in the number of the question(s) that you are continuing to answer at the top of the page.
- Show all your working clearly.** Your working should be in sufficient detail to allow your answers to be checked readily and for marks to be awarded for reasoning. Incorrect answers given without supporting reasoning cannot be allocated any marks. For any question or part question worth more than two marks, valid working or justification is required to receive full marks. If you repeat an answer to any question, ensure that you cancel the answer you do not wish to have marked.
- It is recommended that you **do not use pencil** except in diagrams.

Question 10

(5 marks)

- (a) A and B are two independent events such that $P(A) = 0.2$ and $P(B) = 0.15$.

Evaluate

(i) $P(A|B)$

(1 mark)

(ii) $P(A \cap B)$

(1 mark)

(iii) $P(A \cup B)$

(1 mark)

- (b) The probability that a door to door salesman convinces a customer to buy is 0.4.

Assuming that sales are independent, find the probability that the salesman makes at least one sale before reaching the fourth house. (2 marks)

Question 18

(7 marks)

Climbing rope produced by a manufacturer is known to be such that over a long production run, ten-metre lengths have breaking strengths that are normally distributed with a mean of 180.2kg and standard deviation of 9.5kg.

- (a) Find the probability that a randomly chosen ten-metre length will have a breaking strength of less than 160kg. (1 mark)

- (b) At the start of a production run, a quality control officer at the factory randomly samples 20 ten-metre lengths and after testing, determines that the mean breaking strength of the sample is 176.9kg. Construct a 90% confidence interval for the population mean based on this sample. (3 marks)

- (c) If the quality control officer repeated the same sampling process in (b) every day for 30 consecutive days, how many of the intervals constructed would be expected to include the known mean breaking strength of 180.2kg? You may assume there were no problems with the manufacturing process. (1 mark)

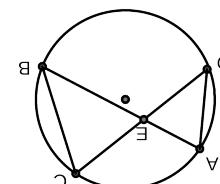

- (d) How large a sample should the quality control officer take, if the probability that the estimated mean breaking strength is in error by more than 2.5kg is to be at most 5%? (2 marks)

Question 17 (6 marks)

In the diagram below the chords AB and CD intersect at the point E.

The area of $\triangle AED$ is 15cm^2 .

Calculate the area of $\triangle ECB$.

(a) When is the body stationary? (2 marks)

(b) When is the body moving fastest? (2 marks)

(c) Explain why $\angle EAD = \angle ECB$. (3 marks)

(d) Prove that $\triangle AED$ is similar to $\triangle ECB$. (2 marks)

(e) Use your result from (b) to show that $AE \times BE = DE \times CE$. (1 mark)

(f) Find the area of $\triangle ECB$ if $CE = 2 \times AE$. (2 marks)

(10 marks)

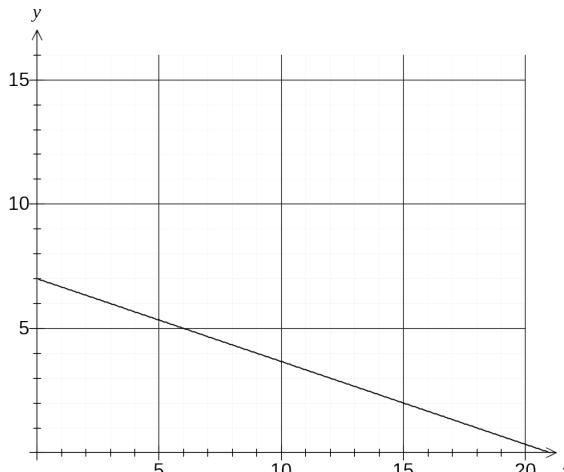

Question 12
Every weekday the chef at a restaurant sends out an apprentice to the local market to spend as little as possible and at the same time come back with at least 16kg of onions, at least 17kg of carrots and at least 21kg of potatoes.

One stall at the market sells 'Best Buy' packs consisting of 2kg of onions, 1kg of carrots and 1kg of potatoes for \$3.50 each. Another stall sells 'Chefs Choice' packs consisting of 1kg of onions, 2kg of carrots and 3kg of potatoes for \$6.50 each.

The apprentice buys x 'Best Buy' packs and y 'Chefs Choice' packs.

- (a) Write down three inequalities to represent the above constraints, apart from $x \geq 0$ and $y \geq 0$. (2 marks)

- (b) Complete the constraints on the graph below and indicate the feasible region. (3 marks)

(7 marks)

Question 16
A factory uses three machines to produce one type of plastic bottle. Of the total production, machine A produces 35%, machine B produces 25% and machine C the rest. Due to the age of the machines, they all produce some defective bottles. Of their production, machines A and B produce 3% and 6% defective bottles respectively.

- (a) Find the probability that a randomly selected bottle is produced by machine A and is defective. (1 mark)

- (b) If the probability of a randomly selected bottle being defective is 0.0455, what percentage of the production of machine C is defective? (4 marks)

- (c) Given that a randomly selected bottle is not defective, find the probability that it was produced by either machine A or machine B. (2 marks)

- (d) By how much can the price of a 'Best Buy' pack rise without changing the optimum number of packs found in your answer to (c)? (2 marks)

- (c) How many of each pack should the apprentice buy to minimise the purchase cost? (3 marks)
- What is the minimum cost?

Question 13

(5 marks)

A sub-committee of four, consisting of a chairperson, a secretary and two ordinary members is to be chosen from a committee of 20 people.

- (a) Find the number of possible choices for

(i) the posts of chairperson and secretary, (1 mark)

(ii) the two ordinary members, (1 mark)

(iii) the chairperson, secretary and two ordinary members. (1 mark)

- (b) If all possible sub-committees are equally likely to be chosen, what is the probability that the chairman of the main committee is not selected in the sub-committee? (2 marks)

Question 14

(11 marks)

A manufacturer of chocolate produces 3 times as many soft centred chocolates as hard centred ones. The chocolates are randomly packed in boxes of 20.

- (a) Find the probability that in a box there are

(i) an equal number of soft centred and hard centred chocolates (3 marks)

(ii) fewer than 5 hard centred chocolates. (1 mark)

(b) Determine the mean and standard deviation of the number of hard centred chocolates in a box of 20. (2 marks)

(c) A random sample of 5 boxes is taken from the production line. Find the probability that exactly 3 of them contain fewer than 5 hard centred chocolates. (2 marks)

(d) A random sample of 30 boxes is taken from the production line. Find the probability that the mean number of hard centred chocolates per box in the sample exceeds 5.5. (3 marks)
