

This section has **eight (8)** questions. Answer **all** questions. Write your answers in the spaces provided.

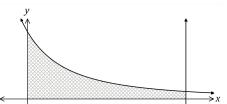

Working time: 50 minutes.

Question 1

(5 marks)

The graph below shows the curve $y = \frac{180}{|2x+5|}$ and the line $x=5$.

Determine the area of the shaded region, enclosed by the x -axis, the y -axis, the line $x=5$ and the curve.

Soluti

$$A = \int_0^5 180(2x+5)^{-2} dx$$

$$= \left[-\frac{180}{2} \times (2x+5)^{-1} \right]_0^5 = -90 \left[\frac{1}{15} (2x+5)^{-1} \right]_0^5$$

$$= -90 \times \frac{-2}{15} \ln 12 \text{ square units}$$

Specific behaviours

- ✓ writes integral
 - ✓ antidifferentiates - correct power
 - ✓ antidifferentiates - correct multipliers
 - ✓ substitutes bounds
 - ✓ signs off

<u>Specific Equations</u>	$\int x \cos(3x) dx = \frac{1}{3} \sin(3x) + C$ $\int 2 \sin(3x) + 6x \cos(3x) dx = -\frac{2}{3} \sin(3x) + 6x^2 + C$ $\int 6x \cos(3x) dx = 2 \int 3x \sin(3x) + 6x^2 + C$ <u>Solution</u>
<u>Uses</u>	<ul style="list-style-type: none"> uses linearity of differentiation uses linearity of anti-differentiation integrates using reverse differentiation obtains expressions involving constant

(c) Use your answer from (b) to determine $\int 6x \cos(3x) dx$. (3 marks)

$$\begin{aligned} \text{Simplification required!} \\ \text{differences correctly} \\ \text{products rule} \\ \text{Derivative of } u \\ \text{Derivative of } v \\ \text{Product Rule} \\ \frac{d}{dx}[uv] = u\frac{dv}{dx} + v\frac{du}{dx} \\ \frac{d}{dx}[x^2 \sin(3x)] = x^2 \frac{d}{dx}[\sin(3x)] + \sin(3x) \frac{d}{dx}[x^2] \\ 2x \sin(3x) + x^2 \cos(3x) \end{aligned}$$

Specific behaviours	
$\frac{1}{\sqrt{x_c^2 + p^2}}$	uses correct form of quotient rule
$\frac{1}{x_c}$	derivative of U
$\frac{1}{x_c^2}$	derivative of V
$\frac{1}{p}$	implication not required

$$\left(x^{\wedge}+1 \right) xp$$

Question 2 (8 marks)

A small body, initially at the origin, moves in a straight line with acceleration $a(t) = 6t - 10 \text{ ms}^{-2}$, where t is the time in seconds, $t \geq 0$. When $t = 5$, it was observed to have a velocity of 31 ms^{-1} .

- (a) Determine an expression for $v(t)$, the velocity of the body. (2 marks)

Solution

$$v(t) = \int a(t) dt = \int (6t - 10) dt = 3t^2 - 10t + c$$

$$3t^2 - 10t + 6 = 193 - 10t - 13 = 0$$

$$3t^2 - 13t + 1 = 0 \Rightarrow t = 1, t = \frac{13}{3}$$

$$a = 6 \times \frac{13}{3} - 10 = 16 \text{ ms}^{-2}$$

Specific behaviours

- ✓ antidifferentiates
- ✓ evaluates constant and states

- (b) Determine the acceleration of the body when $v=19$. (3 marks)

Solution

$$3t^2 - 10t + 6 = 193 - 10t - 13 = 0$$

$$3t^2 - 13t + 1 = 0 \Rightarrow t = 1, t = \frac{13}{3}$$

$$a = 6 \times \frac{13}{3} - 10 = 16 \text{ ms}^{-2}$$

Specific behaviours

- ✓ uses $v=19$ to obtain quadratic equal to zero
- ✓ solves quadratic for t (+ve only)
- ✓ determines

- (c) Determine the velocity of the body as it passes through the origin for the last time. (3 marks)

Solution

$$x(t) = \int v(t) dt = \int (3t^2 - 10t + 6) dt = t^3 - 5t^2 + 6t$$

$$0 = t(t-2)(t-3)$$

$$t = 3$$

$$v(3) = 27 - 30 + 6 = 3 \text{ m/s}$$

Specific behaviours

- ✓ antidifferentiates to obtain displacement equation
- ✓ solves for last

(c) Given that $f(x) = e^{(x^2+2x-3)}$, use the second derivative to justify that one of the stationary points is a local minimum and that the other is a local maximum. (3 marks)

Solution

$$f'(x) = 2x + 2 = 0 \Rightarrow x = -1$$

$$f''(x) = 2 > 0 \text{ at } x = -1 \Rightarrow \text{local minimum when } x = -1$$

Specific behaviours

- ✓ interprets signs of second derivative as required
- ✓ clearly shows $f'(x) = 2x + 2$
- ✓ clearly shows $f''(x) = 2$

- (b) Determine the x -coordinates of the stationary points of $f(x)$. (2 marks)

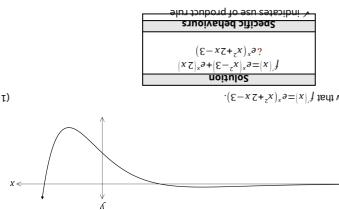

Solution

$$(x+1)(x-3) = 0 \Rightarrow x = -1, 3$$

Specific behaviours

- ✓ identifies use of product rule
- ✓ identifies x -values

- (a) Show that $f(x) = e^{(x^2+2x-3)}$. (1 mark)

- The graph of $y = f(x)$ is shown below, where $f(x) = e^{(x^2+2x-3)}$. (6 marks)
