CHEMISTRY UNITS 1 & 2 2018

| Name: | | |
|----------|--|--|
| | | |
| Teacher: | | |

TIME ALLOWED FOR THIS PAPER

Reading time before commencing work: ten minutes Working time for the paper: three hours

MATERIALS REQUIRED/RECOMMENDED FOR THIS PAPER

To be provided by the supervisor:

This Question/Answer Booklet Multiple-choice Answer Sheet Chemistry Data Book

To be provided by the candidate:

Standard items: pens (blue/black preferred), pencils (including coloured), sharpener,

eraser, correction tape/fluid, ruler, highlighters

Special items: up to three non-programmable calculators approved for use in the

WACE examinations

IMPORTANT NOTE TO CANDIDATES

No other items may be taken into the examination room. It is **your** responsibility to ensure that you do not have any unauthorised notes or other items of a non-personal nature in the examination room. If you have any unauthorised material with you, hand it to the supervisor **before** reading any further.

Structure of this paper

| Section | Number of questions available | Number of questions to be answered | Suggested working time (minutes) | Marks available | Percentage of exam |
|--------------------------------------|-------------------------------|------------------------------------|--|--------------------|--------------------|
| Section One: Multiple-choice | 25 | 25 | 50 | /50 | /25 |
| Section Two: Short answer | 8 | 8 | 60 | /70 | /35 |
| Section Three: Extended answer | 5 | 5 | 70 | /80 | /40 |
| | | | | | /100 |

Instructions to candidates

1. Answer the questions according to the following instructions.

Section One: Answer all questions on the separate Multiple-choice Answer Sheet provided. For each questions shade the box to indicate your answer. Use only a blue or black pen to shade the boxes. If you make a mistake, place a cross through that square then shade your new answer. Do not erase or use correction fluid/tape. Marks will not be deducted for incorrect answers. No marks will be given if more than one answer is completed for any question.

Sections Two and Three: Write your answers in this Question/Answer Booklet.

- 2. When calculating numerical answers, show your working or reasoning clearly. Express numerical answers to the appropriate number of significant figures and include appropriate units where applicable.
- 3. You must be careful to confine your responses to the specific questions asked and to follow any instructions that are specific to a particular question.
- 4. Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.
 - Planning: If you use the spare pages for planning, indicate this clearly at the top of the page.
 - Continuing an answer: If you need to use the space to continue an answer, indicate in the original answer space where the answer is continued, i.e. give the page number. Fill in the number of the question(s) that you are continuing to answer at the top of the page.
- 5. The Chemistry Data Book is **not** handed in with your Question/Answer Booklet.

Section One: Multiple-choice

25% (50 marks)

This section has **25** questions. Answer **all** questions on the separate Multiple-choice Answer Sheet provided. For each question, shade the box to indicate your answer. Use only a blue or black pen to shade the boxes. If you make a mistake, place a cross through that square then shade your new answer. Do not erase or use correction fluid/tape. Marks will not be deducted for incorrect answers. No marks will be given if more than one answer is completed for any question.

Suggested working time: 50 minutes.

Questions 1 and 2 relate to the information given in the following table.

| | Atom | Number of protons | Number of neutrons | Electron configuration |
|-----|--------------|-------------------|--------------------|------------------------|
| I | sodium-22 | 11 | W | 2, 8, 1 |
| II | argon-40 | x | 20 | 2, 8, 8 |
| III | aluminium-27 | 13 | 14 | Y |
| IV | z | 16 | 17 | 2, 8, 6 |

1. Which of the following correctly completes the table above?

| | W | X | Υ | Z |
|-----|----|----|-------------|-----------|
| (a) | 11 | 18 | 2, 8, 3 | sulfur-33 |
| (b) | 12 | 20 | 2, 3 | sulfur-33 |
| (c) | 11 | 18 | 2, 8, 15, 2 | oxygen-16 |
| (d) | 12 | 8 | 2, 8, 3 | sulfur-32 |

- 2. Which of these elements would have the highest electronegativity?
 - (a) I
 - (b) II
 - (c) III
 - (d) IV
- 3. Consider the structural drawing of an ethanol molecule shown below.

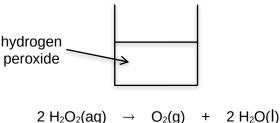

Which of the following statements regarding this molecule is not correct?

- (a) It has 7 polar bonds.
- (b) It has 1 non-polar bond.
- (c) It is a polar molecule.
- (d) It is a symmetrical molecule.

- 4. Which of the following statements regarding the energy changes occurring in an endothermic reaction is **correct**?
 - (a) The system gains energy.
 - (b) The surroundings gain energy.
 - (c) The total energy in the system remains constant.
 - (d) The temperature of the surroundings increases.
- 5. Ethanol has a boiling point of 78.4 °C. Therefore, if a sample of ethanol was compared to a sample of water at 25 °C, it must be **true** that;
 - (a) the vapour pressure of ethanol is greater than that of water.
 - (b) the intermolecular forces in ethanol are stronger than those in water.
 - (c) the density of ethanol is greater than that of water.
 - (d) the boiling point of ethanol is higher than that of water.
- 6. A sample of 0.75 mol L⁻¹ nitric acid solution was poured over a small amount of solid copper(II) oxide powder. Which of the following most accurately describes the observations that would be noted for the reaction that takes place?
 - (a) A blue solid dissolves, producing a clear blue solution.
 - (b) A blue solid dissolves, producing a colourless, odourless gas.
 - (c) A black solid dissolves, producing a clear blue solution.
 - (d) A black solid dissolves, producing a colourless, odourless gas.

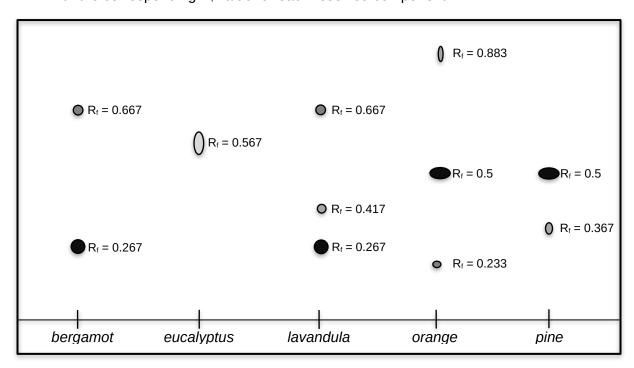

Questions 7 and 8 refer to the reaction described below.

The spontaneous decomposition of hydrogen peroxide solution into oxygen gas and water can be catalysed by the addition of solid manganese(IV) oxide. A beaker was set up as shown in the diagram below.

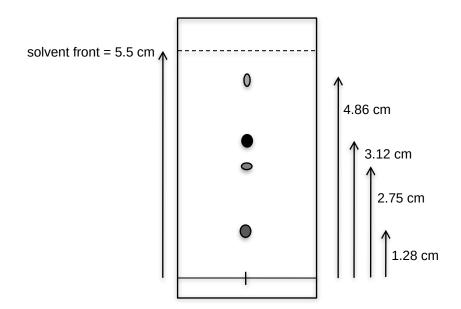

- 7. Which of the following would **not** increase the rate of this reaction?
 - (a) Increasing the pressure surrounding the beaker.
 - (b) Addition of manganese(IV) oxide chips.
 - (c) Addition of powdered manganese(IV) oxide.
 - (d) Increasing the concentration of hydrogen peroxide solution.
- 8. An additional way to increase the rate of this reaction is by gently warming the solution of hydrogen peroxide. Which statement below does **not** contribute to an explanation for the increased reaction rate observed in this case?
 - (a) The particles would have greater kinetic energy.
 - (b) The particles would collide more frequently.
 - (c) The particles would collide with greater force.
 - (d) The particles would collide with the desired orientation.

9. Thin layer chromatography (TLC) was performed on five (5) different essential oils; bergamot, eucalyptus, lavandula, orange and pine. The TLC plate is shown below, along with the corresponding R_f value for each resolved component.

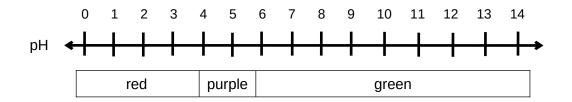

R_f = <u>distance travelled by component</u> distance travelled by solvent

A small amount of an unknown essential oil, labelled as 'Sample X', was then analysed by TLC using identical running conditions. This plate is shown below. Use the data provided to determine which **two** essential oils have been mixed to produce 'Sample X'.

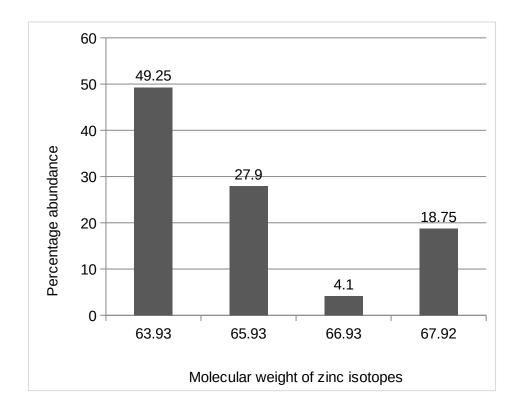

- (a) Bergamot and pine.
- (b) Eucalyptus and lavandula.
- (c) Orange and eucalyptus.
- (d) Lavandula and pine.

10. The juice of blueberries can be used as an acid-base indicator. The diagram below shows the colour displayed by blueberry juice at various pH levels.

Which pair of substances could be distinguished using the blueberry juice indicator?

- (a) HCI(aq) and $H_2O(I)$
- (b) HCl(aq) and HNO₃(aq)
- (c) $NH_3(aq)$ and $Ba(OH)_2(aq)$
- (d) KOH(aq) and $H_2O(1)$
- 11. Which statement regarding ions is **correct**?
 - (a) Cations have a negative charge.
 - (b) Negative ions have lost protons.
 - (c) Positive ions have lost electrons.
 - (d) An example of an anion is NH_4^+ .
- 12. Use the following mass spectrometry data to calculate the relative atomic mass of zinc.

- (a) 65.34
- (b) 65.36
- (c) 65.38
- (d) 65.40

13. Which of the following structural formulas has been drawn **correctly** for the species named?

| (a) nitrate ion | (b) sodium chloride |
|---------------------|----------------------|
| 0 = N - O I O | Na – CI |
| (c) sulfur dioxide | (d) hydrogen cyanide |
| 0-8-0 | H−C ₹ |

- 14. A catalyst, in the form of metal nanoparticles, was found to be successful in increasing the rate of a particular reaction. Which statement regarding this catalyst is **not** correct?
 - (a) The catalyst particles would be in the size range 1-100 nanometres.
 - (b) The catalyst would have all the same properties as the metal in bulk material form.
 - (c) The catalyst would provide a very high surface area.
 - (d) The catalyst would provide an alternate reaction pathway.

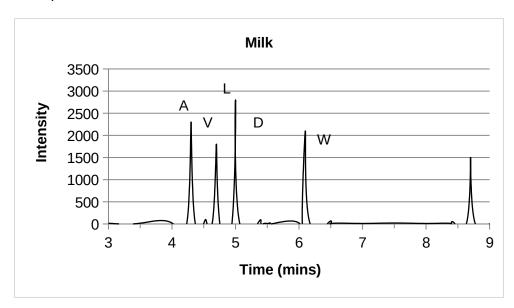

15. Consider the three (3) solvents shown below.

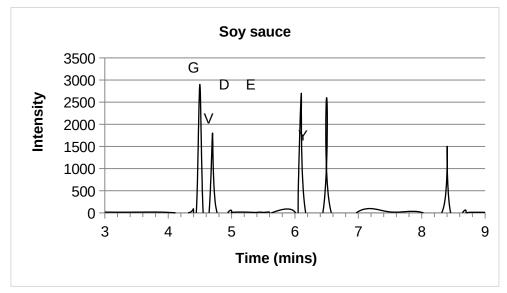

| Methanoic acid | Dichloromethane | Hexane |
|----------------|-------------------|---------------------------------------|
| нсоон(l) | CH₂Cl₂(I) | C ₆ H ₁₄ (I) |
| О С — ОН | H H—C—CI CI | H H H H H H H H H H H H H H H H H H H |

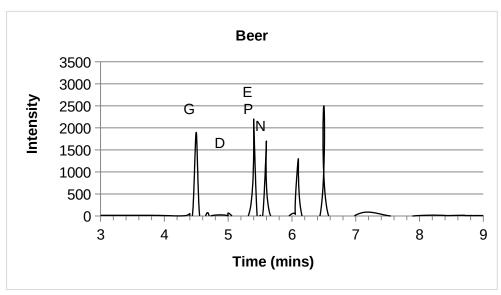

Ammonia (NH₃) will be soluble in;

- (a) methanoic acid only.
- (b) dichloromethane only.
- (c) hexane only.
- (d) methanoic acid and dichloromethane only.

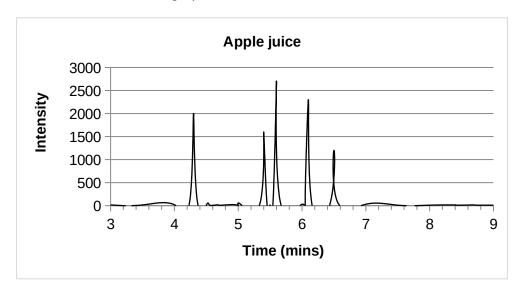

16. Gas chromatography can be used for analysing the presence and type of amino acids in food and drink. The gas chromatographs for milk, soy sauce and beer are shown below, each indicating the five (5) most common amino acids present (labelled in capital letters). Each sample was run under identical conditions.

A sample of apple juice was analysed by gas chromatography, using the same conditions as above, and the chromatograph is shown below.

What is the amino acid composition of apple juice?

- (a) A, P, N, D, E
- (b) G, V, P, D, E
- (c) A, P, N, E, Y
- (d) G, P, N, D, W
- 17. Which of the following is **correct** for a 1.0 mol L⁻¹ solution of ethanoic acid?
 - (a) $c(H^+) > c(CH_3COOH)$
 - (b) $c(H^+) < c(CH_3COO^-)$
 - (c) $c(CH_3COOH) > c(CH_3COO^{-1})$
 - (d) $c(CH_3COOH) = c(H^+)$
- 18. A sample of gas is stored in a sealed container at 20 °C. If this gas was an **ideal** gas, then according to the kinetic theory, which of the following statements is **not** correct?
 - (a) If the container was cooled to absolute zero the gas volume would be zero.
 - (b) If the container was heated to 100 °C the pressure would increase.
 - (c) If the volume of the container was halved the gas particles would move faster.
 - (d) If more gas was added to the container the pressure would increase.
- 19. When 5 mL of potassium carbonate solution (K₂CO₃) was mixed with 10 mL of ethanoic acid solution (CH₃COOH) a chemical reaction took place. Which of the following gives the balanced ionic equation for this reaction?
 - (a) CO_3^2 (aq) + 2 $CH_3COOH(aq) \rightarrow 2 CH_3COO^2(aq) + <math>CO_2(g) + H_2O(l)$
 - (b) $K_2CO_3(s) + 2 CH_3COOH(aq) \rightarrow 2 K^+(aq) + 2 CH_3COO^-(aq) + CO_2(q) + H_2O(1)$
 - (c) $CO_3^{2-}(aq) + 2 H^+(aq) \rightarrow CO_2(g) + H_2O(1)$
 - (d) $K_2CO_3(aq) + 2 H^+(aq) \rightarrow 2 K^+(aq) + CO_2(g) + H_2O(l)$

Questions 20, 21, 22, and 23 relate to the five substances in the table below.

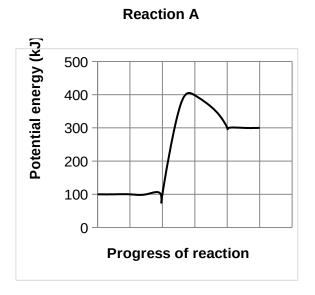

| | Name of substance | |
|-----|----------------------|--|
| I | sulfurous acid | |
| II | calcium phosphate | |
| III | nickel bromide | |
| IV | dinitrogen tetroxide | |
| V | air | |

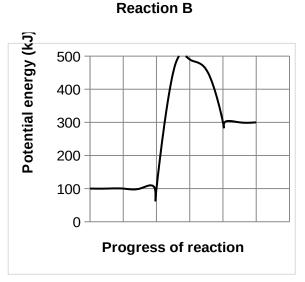

20. Which of the following lists the correct formulas for each substance?

| | I | II | Ш | IV |
|-----|-----------|---------------------------------|----------|----------|
| (a) | H_2S | CaPO₄ | NiBr | N_2O_3 |
| (b) | H_2SO_3 | Ca ₃ PO ₄ | $NiBr_3$ | N^2O^4 |
| (c) | H_2SO_4 | $Ca_2(PO_4)_3$ | $NiBr_2$ | N_2O_4 |
| (d) | H_2SO_3 | $Ca_3(PO_4)_2$ | $NiBr_2$ | N_2O_4 |

- 21. Which of the following statements does **not** help to explain why substance V has no formula?
 - (a) Air is not a pure substance.
 - (b) Air has a variable molecular weight.
 - (c) Air is composed of many different substances.
 - (d) Air has a variable composition.
- 22. Which substance(s) would conduct electricity when mixed with water?
 - (a) I only
 - (b) II and III only
 - (c) III only
 - (d) I and III only
- 23. Which substance is likely to have the highest melting point?
 - (a) I
 - (b) II
 - (c) IV
 - (d) V

- 24. Which of the following statements **cannot** be explained by the presence of hydrogen bonding?
 - (a) Solid water is less dense than liquid water.
 - (b) Water is a highly polar molecule.
 - (c) Water has a high surface tension.
 - (d) Water has a high melting point for a molecule of its molecular weight.
- 25. Consider the energy profile diagrams shown below, for Reaction A and Reaction B.

Which of the following would be **correct** regarding reactions A and B?

- (a) Reaction B is likely to proceed at a faster rate.
- (b) Reactant particles in A likely contain stronger bonds than those in B.
- (c) Reactant particles in B need less energy than those in A, in order to react.
- (d) The temperature change measured for Reaction A and B would be the same.

Section Two: Short answer

35% (70 marks)

This section has **8** questions. Answer **all** questions. Write your answers in the spaces provided.

When calculating numerical answers, show your working or reasoning clearly. Express numerical answers to the appropriate number of significant figures and include appropriate units where applicable.

Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.

- Planning: If you use the spare pages for planning, indicate this clearly at the top of the page.
- Continuing an answer: If you need to use the space to continue an answer, indicate in the
 original answer space where the answer is continued, i.e. give the page number. Fill in the
 number of the question(s) that you are continuing to answer at the top of the page.

Suggested working time: 60 minutes.

Question 26 (6 marks)

(a) Complete the following table by either giving the correct IUPAC name of the substance or drawing a structural diagram for the organic molecule named. (3 marks)

| Structural diagram | IUPAC name |
|--|-------------------------------|
| $C = C - C - C - H$ H_3C H_3C H_3C H_4 H_5 H_6 H_7 | |
| $\begin{array}{c ccccccccccccccccccccccccccccccccccc$ | |
| | 4-bromo-1,2-difluorobut-1-ene |

(b) Write the equation for the reaction that would take place between methylbenzene and liquid bromine in the presence of an aluminium bromide catalyst. (3 marks)

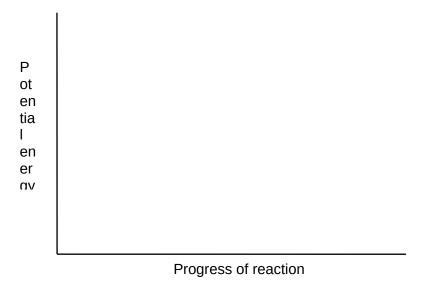

Question 27 (8 marks)

Fireflies 'glow' due to a special chemical reaction that produces light. Fireflies have a substance in their bodies called 'luciferin'. The compound luciferin is oxidised to oxyluciferin by the enzyme *luciferase*. ATP is an organic compound that provides energy for the reaction to take place. The word equation for the 'glow' reaction in fireflies is shown below.

luciferin + ATP + oxygen gas

luciferin + AMP + light → oxyluciferin + AMP + light

(a) Sketch an energy profile diagram for this reaction, in the absence of the *luciferase* enzyme. Label the change in enthalpy and the activation energy. (3 marks)

(b) Add to the energy profile diagram above, the effect of the *luciferase* enzyme on this reaction. (1 mark)

(c) Define an 'enzyme' and explain, in terms of the collision theory, how enzymes increase the rate of a reaction. (3 marks)

(d) State the role of ATP in this reaction, in terms of the collision theory. (1 mark)

Question 28 (11 marks)

| Seawater contains many different dissolved ions, such as sodium (Na†), magnesium (M | $g^{2+}),$ |
|---|------------|
| chloride (Cl⁻), hydrogencarboante (HCO₃⁻) and barium (Ba²+). | |

| (a) | The concentration of barium ions (Ba ²⁺) in seawater is 0.025 ppm | . If you had a 250 mL |
|-----|---|-----------------------|
| | sample of seawater, how many barium ions would be present? As | ssume the density of |
| | seawater is 1.00 kg L ⁻¹ . | (4 marks) |

| (b) | Draw a labelled diagram showing how dissolved Ba ²⁺ and Cl ⁻ io water molecules in the ocean. | ons would interact with the (3 marks |
|-----|---|---|
| | | |
| | | |
| | | |
| | | |

The solubility of barium chloride (BaCl₂) is 35.8 g per 100 mL water at 20 °C.

| (c) | How would you produce a saturated solution of barium chloride if you had 250n at 20 °C? | nL of water (2 marks) |
|-----|--|---------------------------------|
| | | |

The sea surface temperature at Cottesloe beach in summer can reach 23 °C.

| (d) | If your saturated solution from (c) was heated to 23 °C, would the solutio | n now likely be |
|-----|--|-----------------|
| | saturated, unsaturated or supersaturated? Justify your answer. | (2 marks) |
| | | |
| | - | |

Question 29 (8 marks)

Consider the information in the table, regarding the conductivity of substances W, X, Y and Z.

| Substance | Conductivity (l) | Conductivity (aq) |
|-----------|------------------|---------------------------|
| W | no | yes |
| Х | yes | yes |
| Y | no | no (not soluble in water) |
| Z | yes | no (not soluble in water) |

| - | | |
|--------------------------|---|--------------------------------|
| - | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| Name or give the formula | for one possible identity of substance W. | (1 m |
| | for one possible identity of substance W. es is most likely to be diamond? Briefly describe | (1 m e the structur (3 m |
| Which of these substance | | e the structu |
| Which of these substance | | e the structu |

Question 30 (10 marks)

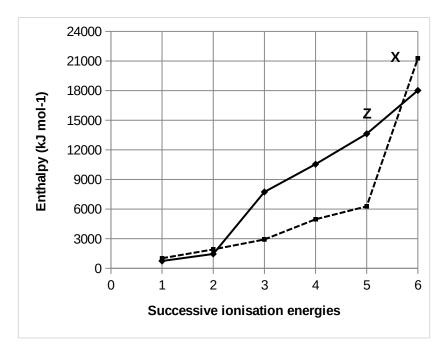

Some chemistry students were investigating the pH of various compounds. In particular, they were investigating sodium hydroxide (NaOH) and ammonia (NH₃). The students knew that both of these compounds were classified as bases because they produce hydroxide ions (OH) in solution.

They were given a sample of 0.5 mol L^{-1} NaOH(aq) and 0.5 mol L^{-1} NH₃(aq). The students added a few drops of universal indicator to each solution.

| (a) | What is an indicator? | (1 mark) |
|-------|---|-----------------|
| (b) | Explain why the NaOH(aq) would have a higher pH than the NH ₃ (aq). | (4 marks) |
| | | |
| | | |
| hydr | students' teacher was explaining that the pH scale is a measure of the concen ogen ions (H⁺) in a solution . One of the students asked, "According to the Ar ses are substances that produce hydroxide ions in solution, how can their pH | rhenius theory, |
| (c) | Briefly answer the student's question. | (3 marks) |
| | | |
| | | |
| | students then investigated a chemical reaction involving both sodium hydroxide noted the following observations in their laboratory book; | e and ammonia |
| smell | ear colourless solution with a highly basic pH was added to a white powder. A ling odour was detected and the white powder dissolved forming a clear, colou solution was later determined to be aqueous sodium chloride." | |
| (d) | Write the balanced chemical equation for this reaction. | (2 marks) |
| | | |

Question 31 (9 marks)

Consider the graph below, which shows the first six (6) ionisation energies of magnesium and phosphorus.

(a) Complete the table below, by writing the electron configuration for magnesium and phosphorus, as well as identifying which line on the graph (X or Z) corresponds to each element. (3 marks)

| | Electron configuration | Line X or Z? |
|------------|------------------------|--------------|
| Magnesium | | |
| Phosphorus | | |

| Why is the first ionisation energy of X higher than that of Z? | (3 marks) |
|---|-------------------------|
| | |
| | |
| | |
| | |
| Describe how X and Z could combine by forming chemical bonds. Give the form most likely compound that would form. | ula of the (3 marks) |
| | |
| | |
| | |

Question 32 (8 marks)

Azurite, $Cu_3(CO_3)_2(OH)_2$, is a common copper-containing compound found in some copper ores.

(a) Calculate the percentage by mass of copper in azurite, Cu₃(CO₃)₂(OH)₂.

(2 marks)

Some copper ore, containing 61.5% azurite, was smelted to extract the copper according to the equation below.

$$2 Cu_3(CO_3)_2(OH)_2(s) + 3 C(s) \rightarrow 6 Cu(s) + 7 CO_2(g) + 2 H_2O(g)$$

If 2.98 tonnes of copper was produced;

(b) Calculate the volume of carbon dioxide (at STP) that would have been released. (3 marks)

(c) Calculate the mass of azurite, Cu₃(CO₃)₂(OH)₂, that was smelted. (2 marks)

(d) Calculate the mass of ore that would have been required as the starting material. (1 mark)

Question 33 (10 marks)

The diagram below shows some of the gases that enter and exit a catalytic converter.

| (a) | What is the function of a catalytic converter? | (1 mark) |
|-----|--|----------|
| | | |
| | - | |
| | | |

- (b) Choose three (3) of the gases labelled in the diagram above and complete the following table by;
 - drawing the structural formula for each molecule, representing all valence shell electron pairs either as: or –,
 - naming the shape of the molecule, and
 - stating the most significant intermolecular forces present in a pure sample.

Each of your chosen gases must have a <u>different</u> molecular shape. (9 marks)

| Electron dot diagram | Shape | Intermolecular forces |
|----------------------|-------|-----------------------|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

End of Section Two

Section Three: Extended answer

40% (80 marks)

This section contains **five (5)** questions. You must answer **all** questions. Write your answers in the spaces provided below.

Where questions require an explanation and/or description, marks are awarded for the relevant chemical content and also for coherence and clarity of expression. Lists or dot points are unlikely to gain full marks.

Final answers to calculations should be expressed to the appropriate number of significant figures.

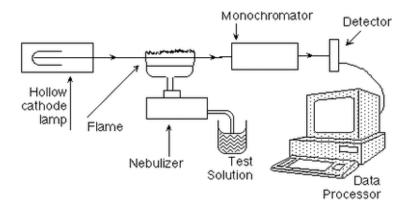

Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.

- Planning: If you use the spare pages for planning, indicate this clearly at the top of the page.
- Continuing an answer: If you need to use the space to continue an answer, indicate in the
 original answer space where the answer is continued, i.e. give the page number. Fill in the
 number of the question(s) that you are continuing to answer at the top of the page.

Suggested working time: 70 minutes.

Question 34 (14 marks)

Several different brands of sports drinks were analysed by atomic absorption spectroscopy (AAS) to determine their sodium content. Sports drinks contain sodium in the form of sodium ions, Na⁺. A diagram of the equipment used in AAS is shown below.

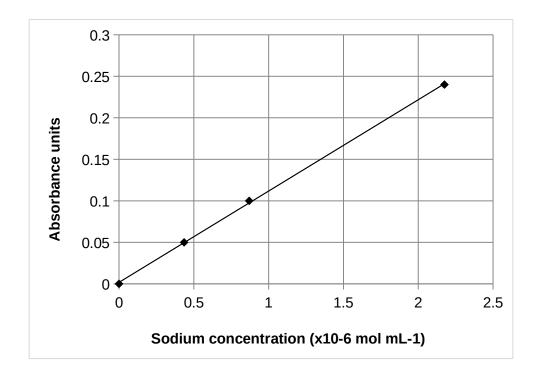

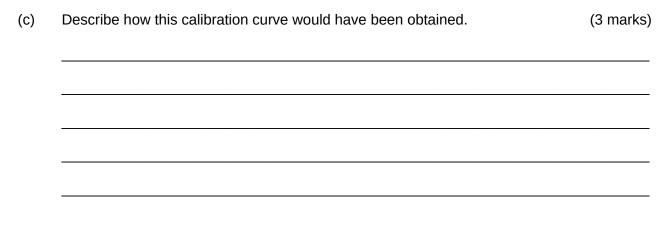

In this analysis, the element in the hollow cathode lamp contained sodium (Na). When the lamp is turned on, the atoms of sodium produce an emission spectrum that is unique to the sodium element.

| Explain how sodium atoms are able to produce this unique emission spectrum. | (3 ma |
|---|-------|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| (b) | Why does the emission spectrum of the hollow cathode lamp need to match the metal | |
|-----|---|-----------|
| | being analysed by AAS? | (2 marks) |
| | | |
| | | |
| | | |

Samples of each sports drink were diluted with water and then run through the spectrometer. Absorbance values for each were collected. The data was then compared to an existing calibration curve for sodium, which is shown below.

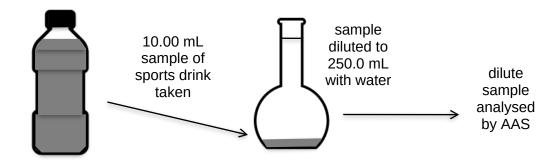

Using the calibration curve above, the concentration for a particular diluted sports drink was determined to be 1.11×10^{-6} mol mL⁻¹.

(d) What absorbance would this correspond to? (1 mark)

A 10.00 mL sample of a sports drink was taken and diluted to a final volume of 250.0 mL by the addition of water. A portion of the dilute sample was analysed by AAS.

The absorbance obtained was compared to the calibration curve and the concentration was determined to be 1.11×10^{-6} mol mL⁻¹ as previously stated.

(e) Calculate the concentration of sodium (in mol L⁻¹) in the **undiluted** sports drink. (3 marks)

The sports drink was sold in a 600 mL bottle.

(f) Calculate the total mass of sodium present in the drink.

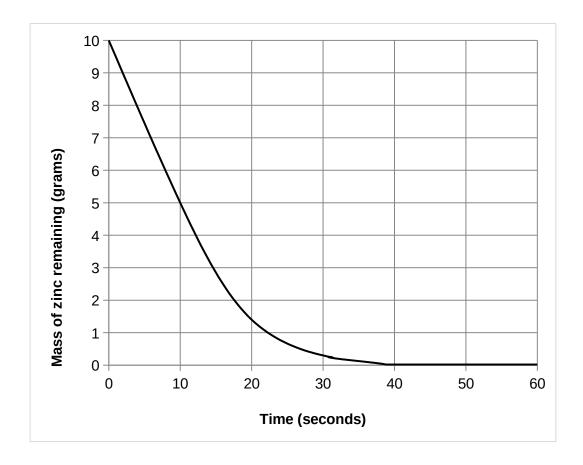

(2 marks)

Question 35 (15 marks)

A chemistry class was investigating the topic of reaction rate. The students decided to use the reaction between solid zinc granules and hydrochloric acid, because they would be able to time how long it took for the zinc to completely dissolve. The students wanted to see how the rate of a reaction changes over time. They wrote the following hypothesis;

"The rate of reaction will decrease over time and this will be observed by a uniform (linear) decrease in the mass of zinc present in the beaker."

The data collected by the students is represented in the graph below.

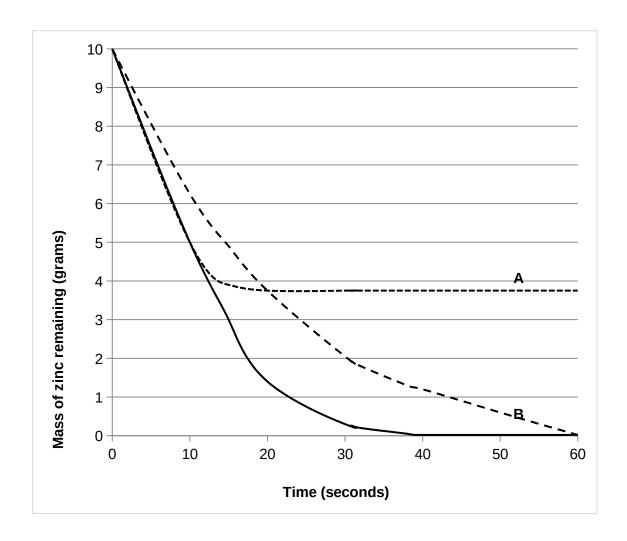

(a) Write a balanced ionic equation for the reaction that is occurring in this investigation. State the corresponding observations. (4 marks)

| Ionic equation | |
|----------------|--|
| Observations | |

- (b) How long did it take before; (2 marks)
 - (i) half of the zinc had reacted?
 - (ii) the rate of the reaction became zero?
- (c) Was the students' hypothesis completely supported? Justify your answer by referring to the graph. (2 marks)

The students then performed three (3) variations of the investigation described above. They altered one particular aspect of the experiment each time, to determine the effect of the various factors on the rate of reaction.

The results of two (2) of the variations, labelled A and B, are shown in the graph below (dotted lines). The original data is also displayed for comparison (solid line).

Consider lines A and B on the graph on page 24. In each of these experiments, **only one** variable was changed in comparison with the original experiment (solid line). The changes made were;

- the concentration of acid was halved
- the volume of acid was halved

| (d) | Complete the table below by stating which line on the graph corresponds to the | changes |
|-----|--|-----------|
| | made to the original experiment. | (2 marks) |

| | A or B? |
|---------------------------------------|---------|
| The concentration of acid was halved. | |
| The volume of acid was halved. | |

| (e) | Justify your choices in part (d) by referring to the graph. | (4 marks) | |
|-----|---|-----------|--|
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |

The third variation of the experiment that the students investigated was increasing the temperature of the hydrochloric acid before pouring it over the zinc granules.

(f) Sketch a fourth line, labelled C, on the graph on page 24, displaying the results you would expect the students to have obtained. (1 mark)

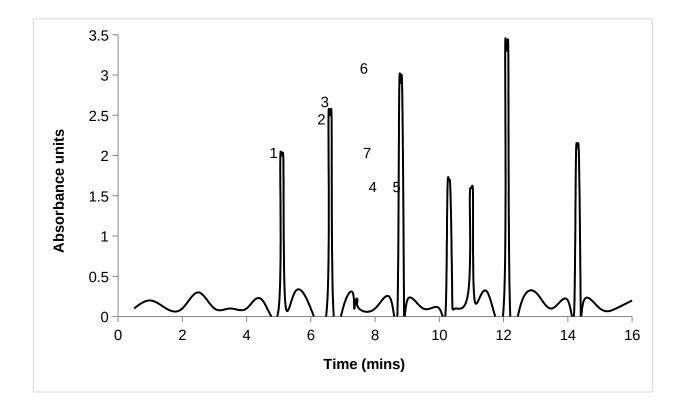

Question 36 (17 marks)

High performance liquid chromatography (HPLC) is often used to test water for potential contamination. One particular analysis determines the levels of a range of polycyclic aromatic hydrocarbons (PAHs) in water. These pollutants are naturally occurring, but can be damaging when consumed in high levels.

The table below provides information about seven (7) different PAHs that commonly appear in water samples.

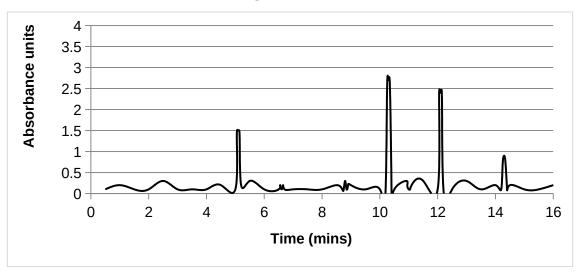

| | РАН | MF | Source of PAH | |
|---|-------------------|---------------------------------|---------------------------|--|
| 1 | naphthalene | C ₁₀ H ₈ | coal tar, petroleum | |
| 2 | fluorene | C ₁₃ H ₁₀ | coal tar | |
| 3 | anthracene | C ₁₄ H ₁₀ | coal tar | |
| 4 | pyrene | C ₁₆ H ₁₀ | crude oil, fossil fuels | |
| 5 | chrysene | C ₁₈ H ₁₂ | coal tar | |
| 6 | benzofluoranthene | C ₂₀ H ₁₂ | crude oil, petrol exhaust | |
| 7 | indenopyrene | C ₂₂ H ₁₂ | coal tar, diesel exhaust | |

HPLC analysis can determine both the presence and concentration of these PAHs in a water sample. The chromatogram below is a control, showing each of the seven PAHs and their corresponding retention times. The absorbance readings were recorded at 254 nm.

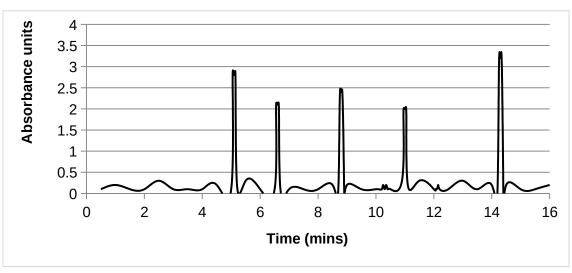

Three water samples (A, B and C) were collected from various locations and analysed for the presence of these seven PAHs. The HPLC conditions used were identical to those used in the control chromatogram. The results of the three analyses are shown in the chromatograms below.

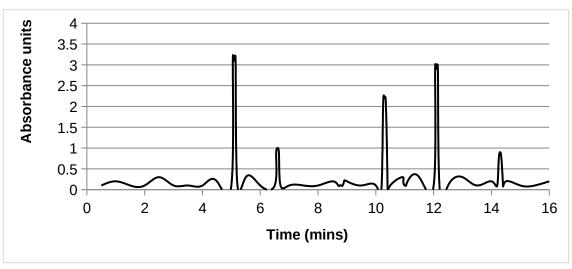

SAMPLE A

SAMPLE B

SAMPLE C

| (f) | If a polar compound was identified by this HPLC analysis, what retention time wo predict it to have? Justify your answer. | | | |

Question 37 (17 marks)

Propane (C_3H_8) can be obtained from the processing of natural gas or petroleum refining. It is a gas at room temperature, but can be liquefied by pressure, which makes it easy to transport and store. For this reason, propane is a commonly used fuel in barbeques, portables stoves and heating devices.

The combustion equation for propane is;

$$C_3H_8(g) + 5 O_2(g) \rightarrow 3 CO_2(g) + 4 H_2O(g) + 2220 kJ$$

If 455 kg of propane was combusted in air, calculate;

(a) the volume of gaseous products that would form at STP. (5 marks)

(b) the energy released.

(1 mark)

Biopropane is a biofuel and refers to propane that has been produced from renewable resources using biological processes. It is referred to as a 'drop in' fuel, because it has exactly the same molecular structure as propane, and can therefore be used for the same purposes. Biopropane can be produced by hydrogenating vegetable or animal fats and oils.

Question 38 (17 marks)

A chemistry student has a solution of silver nitrate, AgNO₃(aq), with a labelled concentration of 0.0425 g mL⁻¹. The student measured out 75.0 mL of the AgNO₃(aq) and placed it in a beaker.

(a) Calculate the concentration of the AgNO₃(aq) solution in moles per litre. (2 marks)

The student then added 100.0 mL of 0.12 mol L^{-1} sodium carbonate solution, $Na_2CO_3(aq)$. They ensured there was excess $Na_2CO_3(aq)$ present in order to precipitate all the silver ions from solution.

The equation for the reaction that took place is;

$$2 \text{ AgNO}_3(aq) + \text{Na}_2\text{CO}_3(aq) \rightarrow \text{Ag}_2\text{CO}_3(s) + 2 \text{NaNO}_3(aq)$$

| (b) | State the observations that would have been made as the reaction took place. | | | |
|-----|--|--|--|--|
| | | | | |
| | | | | |
| | | | | |

(c) Calculate the concentration of sodium ions, Na⁺(aq), that would be present after the two solutions were mixed. (4 marks)

| The st | The student then filtered the mixture to collect the $Ag_2CO_3(s)$ precipitate. | | | | |
|--------|---|-----------------------|--|--|--|
| (d) | Draw a labelled diagram of the equipment the student would use. Indicate where products of the reaction would finish and use the labels 'filtrate' and 'residue' in y answer. | | | | |
| (e) | Calculate the mass of $Ag_2CO_3(s)$ precipitate, once dried, that would have been so from this mixture. | eparated (3 marks) | | | |
| | udent then poured the remaining filtered solution into an evaporating dish and hea over a Bunsen burner until no liquid remained. | ated it | | | |
| (f) | Name the two (2) solids that would have been present on the evaporating dish. | (1 mark) | | | |
| (g) | Briefly explain why these solids could not be isolated by filtration. | (1 mark) | | | |
