# CHEMISTRY

Student Name  _____

Student Number:      In figures      ☐☐ ☐☐☐ ☐☐☐

In words      _____

_____

| Section | Marks |
|---------|-------|
| 1 | /25 |
| | **/50** |
| 2 | **/70** |
| 3 | **/80** |
| total | **/200** |
| | **%** |

## Time allowed for this paper

Reading time before commencing work:      ten minutes
Working time for paper:      three hours

## Material required/recommended for this paper

***To be provided by the supervisor***
This Question/Answer booklet
Multiple-choice Answer sheet
Chemistry Data sheet

***To be provided by the candidate***
Standard items:      pens (blue/black preferred), pencils (including coloured), sharpener, correction
fluid/tape, eraser, ruler, highlighters

Special items:      up to three non-programmable calculators approved for use in the WACE
examinations

## Important note to candidates

No other items may be taken into the examination room. It is **your** responsibility to ensure that you do not have any unauthorised notes or other items of a non-personal nature in the examination room. If you have any unauthorised material with you, hand it to the supervisor **before** reading any further.

## Structure of this paper

| Section | Number of questions available | Number of questions to be answered | Suggested working time (minutes) | Marks available | Percentage of exam |
|---|---|---|---|---|---|
| Section One: Multiple-choice | 25 | 25 | 50 | 25 | 25 |
| Section Two: Short answer | 9 | 9 | 60 | 70 | 35 |
| Section Three: Extended answer | 5 | 5 | 70 | 80 | 40 |
| | | | | **Total** | 100 |

## Instructions to candidates

1.  The rules for the conduct of Western Australian external examinations are detailed in the *Year 12 Information Handbook 2016*. Sitting this examination implies that you agree to abide by these rules.

2.  Answer the questions according to the following instructions.

    Section One:  Answer all questions on the separate Multiple-choice Answer Sheet provided. For each question, shade the box to indicate your answer. Use only a blue or black pen to shade the boxes. If you make a mistake, place a cross through that square, then shade your new answer. Do not erase or use correction fluid/tape. Marks will not be deducted for incorrect answers. No marks will be given if more than one answer is completed for any question.

    Sections Two and Three:  Write your answers in this Question/Answer Booklet.

3.  When calculating numerical answers, show your working or reasoning clearly. Express numerical answers to the appropriate number of significant figures and include appropriate units where applicable.

4.  You must be careful to confine your responses to the specific questions asked and to follow any instructions that are specific to a particular question.

5.  Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.
    *   Planning:  If you use the spare pages for planning, indicate this clearly at the top of the page.
    *   Continuing an answer:  If you need to use the space to continue an answer, indicate in the original answer space where the answer is continued, i.e. give the page number.     Fill in the number of question that you are continuing to answer at the top of the page.

6.  The Chemistry Data Booklet is **not** handed in with your Question/Answer Booklet.

**See next page**

**Section One:  Multiple-choice**                                                    **25%  (25 marks)**

This section has **25** questions. Answer **all** questions on the separate Multiple-choice Answer Sheet provided. For each question shade the box to indicate your answer. Use only a blue or black pen to shade the boxes. If you make a mistake, place a cross through that square, then shade your new answer. Do not erase or use correction fluid/tape. Marks will not be deducted for incorrect answers. No marks will be given if more than one answer is completed for any question.

Suggested working time:  50 minutes.

---

1.      Which one of the following substances is the strongest acid?

        (a)     HF
        (b)     $HNO_3$
        (c)     $H_3PO_4$
        (d)     $CH_3COOH$

2.      Which one of the following substances is the strongest reducing agent?

        (a)     Au
        (b)     Sr
        (c)     $FeI_3$
        (d)     $H_2O_2$

3.      Consider the following system at equilibrium.

            $Pb^{2+}(aq) + 2 Br^-(aq) \rightleftharpoons PbBr_2(s) + heat$
        Which one of the following changes would cause the concentration of lead(II) ions to be lowered (compared to the original concentration) once equilibrium is re-established?

        (a)     Adding potassium iodide solution.
        (b)     Stirring the mixture.
        (c)     Warming the system.
        (d)     Adding solid lead(II) bromide to the system.

4.      In which one of the following reactions is the carbon-containing species acting as a Brønsted-Lowry acid?

        (a)     $NaHCO_3(s) + H^+(aq) \rightarrow Na^+(aq) + H_2O(\ell) + CO_2(g)$
        (b)     $CO_2(g) + H_2O(\ell) \rightarrow H_2CO_3(aq)$
        (c)     $H_2CO_3(aq) + NaOH \rightarrow NaHCO_3(aq) + H_2O(\ell)$
        (d)     $CO_3^{2-}(aq) + Ca^{2+}(aq) \rightarrow CaCO_3(s)$

**See next page**

5.   Use the information in the table below to determine which acid will have the lowest pH?

| Name | Formula | Equilibrium constant K |
|------|---------|------------------------|
| Benzoic acid | $C_6H_5COOH$ | $6.3 \times 10^{-5}$ |
| Hypochlorous acid | $HC\square O$ | $2.9 \times 10^{-8}$ |
| Hydrocyanic acid | $HCN$ | $6.2 \times 10^{-10}$ |
| Methanoic acid | $HCOOH$ | $1.8 \times 10^{-4}$ |

(a)   Benzoic acid
(b)   Hypochlorous acid
(c)   Hydrocyanic acid
(d)   Methanoic acid

6.   Which of the following combinations will form a buffer solution?

   i.   $NH_3(aq) / NH_4C\ell(aq)$
   ii.   $NH_3(aq) / HC\ell(aq)$
   iii.   $HC\ell(aq) / NH_4C\ell(aq)$
   iv.   $H_2PO_4^-(aq) / HPO_4^{2-}(aq)$
   v.   $H_2SO_4(aq) / HSO_4^-(aq)$

(a)   i and iv only
(b)   i, iv and v only
(c)   i, ii and iv only
(d)   iv only

**Question 7 and 8 relate the following information:**

One of the processes involved in the acidification of the oceans caused by increasing carbon dioxide levels in the atmosphere is shown below:

$$HCO_3^-(aq) \rightleftharpoons CO_3^{2-}(aq) + H^+(aq)$$

7.   Which one of the following statements is true?

(a)   $HCO_3^-$ is the conjugate base of the $CO_3^{2-}$ ion.
(b)   The $HCO_3^-$ ion is the conjugate acid of the $H^+$ ion.
(c)   $HCO_3^-$ is the conjugate acid of the $CO_3^{2-}$ ion.
(d)   $H^+$ is the conjugate acid of the $HCO_3^-$ ion.

8.   Using this process and your knowledge of other chemical processes occurring in the ocean, which one of the following will reduce the acidity of the oceans?

(a)   increased amount of sediments and shells that contain calcium carbonate.
(b)   Increased concentration of carbon dioxide in the atmosphere
(c)   Addition of more hydrogencarbonate ions into the ocean
(d)   Increased extreme weather conditions causing wind and waves in the ocean

9. Water ionises according to the following reaction.

   $$2\ H_2O(\ell)\ \rightleftharpoons\ OH^-(aq)\ +\ H_3O^+(aq)$$
   At 25 °C the concentration of $H^+$ is $10^{-7}$ mol $L^{-1}$ and the pH of pure water is 7.0. When the temperature is increased, the pH of water reduces. Which of the following statements below is correct?

   (a)     The forward reaction is endothermic.
   (b)     The concentration of $OH^-(aq)$ reduces, making the water more acidic.
   (c)     The water is no longer neutral, so the pH of water reduces.
   (d)     The concentration of the $H_3O^+(aq)$ reduces.

10. Consider the section of the polymer below.

   Which one of the following is the correct name for the monomer used to synthesise this polymer?

   (a)     but-1-ene
   (b)     but-2-ene
   (c)     2-methylpropene
   (d)     2,2-dimethylethene

11. In which of the following processes is chlorine being oxidised?

   i.     $PC\ell_3\ +\ C\ell_2\ \rightarrow\ PC\ell_5$
   ii.    $C\ell_2\ +\ H_2O\ \rightarrow\ C\ell^-\ +\ HC\ell O\ +\ H^+$
   iii.   $2\ C\ell^-\ \rightarrow\ C\ell_2\ +\ 2\ e^-$
   iv.   $HC\ell O_3\ +\ H_2O_2\ \rightarrow\ HC\ell O_4\ +\ H_2O$

   (a)     i, ii and iv only
   (b)     ii, iii and iv only
   (c)     i, ii, iii and iv
   (d)     ii and iv only

**The following diagram relates to questions 12 and 13**

The following galvanic cell was set up.

Cu

Zn

**V**

Salt Bridge

0.1 mol $L^{-1}$ Cu(NO$_3$)$_2$

0.1 mol $L^{-1}$ Zn(NO$_3$)$_2$
12.  Which one of the following is the purpose of the salt bridge?

(a)  To increase the concentration of the ions in order to speed up the rate of the reaction.
(b)  To allow the flow of electrons between the two electrodes.
(c)  To complete the circuit to allow ions to flow between the two half-cells.
(d)  To allow copper ions to flow to the zinc electrode

13.  Which one of the following statements is **false**?

(a)  The zinc electrode is the anode.
(b)  The electrons in the wire move towards the copper electrode.
(c)  The mass of the copper electrode will increase.
(d)  Positive ions in the salt bridge move towards the zinc electrode.

14.  Which of the following reactions will occur spontaneously?

   i.    $2\ I^-(aq)\ +\ Br_2(aq)\ \rightarrow\ 2\ Br^-(aq)\ +\ I_2(aq)$
  ii.    $Cu(s)\ +\ 2\ HC\ell(aq)\ \rightarrow\ CuC\ell_2(aq)\ +\ H_2(aq)$
 iii.    $Sn(s)\ +\ Cd^{2+}(aq)\ \rightarrow\ Sn^{2+}(aq)\ +\ Cd(s)$
 iv.    $H_2O_2(aq)\ +\ Ni^{2+}(aq)\ \rightarrow\ O_2(g)\ +\ 2\ H^+(aq)\ +\ Ni(s)$

(a)  i and iv only
(b)  i only
(c)  iii and iv
(d)  iv only

**See next page**

**Question 15, 16 and 17 relate to the following information**

An aluminium-air battery is a fuel cell that involves aluminium reacting with oxygen in the air. The relevant half-equations are shown below.

$$O_2(g) + 2 H_2O(\ell) + 4 e^- \rightleftharpoons 4 OH^-(aq)$$

$$A\ell^{3+}(aq) + 3 e^- \rightleftharpoons A\ell(s)$$
15. This cell is described as a fuel cell because

    (a) it is a sustainable power source that can be used to replace fossil fuels.
    (b) both half-reactions are reversible so the cell can be recharged.
    (c) it involves a gas as a reactant at one of the electrodes.
    (d) it requires the reactants to be supplied to the cell during operation.

16. Which one of the following is the overall equation for the cell?

    (a) $A\ell(s) + O_2(g) + 2 H_2O(\ell) \rightarrow OH^-(aq) + A\ell^{3+}(aq)$
    (b) $4 A\ell^{3+}(aq) + 3 O_2(g) + 6 H_2O(\ell) \rightarrow 12 OH^-(aq) + 4 A\ell(s)$
    (c) $A\ell^{3+}(aq) + O_2(g) + 2 H_2O(\ell) \rightarrow 4 OH^-(aq) + A\ell(s)$
    (d) $4 A\ell(s) + 3 O_2(g) + 6 H_2O(\ell) \rightarrow 12 OH^-(aq) + 4 A\ell^{3+}(aq)$

17. The theoretical voltage obtainable from this cell is

    (a) 1.88 V.
    (b) 2.08 V.
    (c) 2.91 V.
    (d) 5.52 V.

18. Substance **X** has an empirical formula of $C_2H_4O$. Which one of the following could **not** be substance **X**?

    (a) butanoic acid
    (b) ethyl ethanoate
    (c) methyl methanoate
    (d) methyl propanoate

19. Which one of the following compounds will be readily oxidised to form a carboxylic acid?

    (a) $CH_3CH_2C(OH)CH_3$
    (b) $HOC(CH_3)_3$
    (c) $CH_3CH_2COOCH_3$
    (d) $CH_3CH_2CHO$

**See next page**

20. The following two substances were reacted together:

Which one of the following would be the type of product produced?

(a) a soap
(b) a fatty acid
(c) a polyester
(d) a protein

21. Which one of the following pairs of compounds would form methyl propanoate when warmed with concentrated sulfuric acid?

(a) $CH_4$ and $CH_3CH_2COOH$
(b) $CH_3OH$ and $CH_3CH_2CH_2OH$
(c) $CH_3OH$ and $CH_3CH_2COOH$
(d) $HCOOH$ and $CH_3CH_2CH_2OH$

22. Consider the dipeptide below.

$HOOCCH(CH_3)NHCOCH(CH_2OH)NH_2$

Use your data sheet to identify which pair of amino acids below would form this dipeptide.

(a) alanine and valine
(b) valine and threonine
(c) glycine and serine
(d) serine and alanine

**See next page**

23.    Consider the molecule below.

       Which one of the following will this molecule **not** react with?

       (a)    dilute hydrochloric acid
       (b)    sodium hydrogencarbonate solution
       (c)    sodium chloride solution
       (d)    sodium hydroxide solution

24.    Which one of the following are **not** bonds between sections of a protein that contribute to the tertiary structure of the protein?

       (a)    C=O bonds
       (b)    hydrogen bonds
       (c)    S–S bonds
       (d)    dispersion forces

25.    Which one of the following is **not** an aim of the Protein Data Bank? (PDB)?

       (a)    Standardising the way protein structures are represented.
       (b)    Allowing companies to patent new discoveries of protein structures.
       (c)    Informing medical research such as development of the use of antibodies.
       (d)    Sharing knowledge of protein structures from scientists across the world.

**End of Section One**

**See next page**

**Section Two:  Short answer**                                                      **35%  (70 Marks)**

This section has **ten (10)** questions. Answer **all** questions. Write your answers in the spaces provided.

When calculating numerical answers, show your working or reasoning clearly. Express numerical answers to the appropriate number of significant figures and include appropriate units where applicable.

Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.
- Planning: If you use the spare pages for planning, indicate this clearly at the top of the page.
- Continuing an answer: If you need to use the space to continue an answer, indicate in the original answer space where the answer is continued, i.e. give the page number. Fill in the number of the question that you are continuing to answer at the top of the page.

Suggested working time: 60 minutes.

---

**Question 26**                                                                    **(5 marks)**

(a)     Calculate the pH of a solution of 0.500 mol $L^{-1}$ hydrochloric acid.                    (2 marks)

(b)     A student was asked to dilute 50.0 mL of the 0.500 mol $L^{-1}$ hydrochloric acid solution to produce a solution of hydrochloric acid with a pH of 2.00. Calculate the volume of distilled water that she would she need to add.

(3 marks)

**See next page**

**Question 27**          **(6 marks)**

Butan-2-ol can be oxidised with acidified potassium dichromate solution.

(a)      Draw the structural formula and name the organic product formed.      (2 marks)

Name _____

(b)      (i)      Draw and name an isomer of butan-2-ol that will react with potassium dichromate solution to produce a carboxylic acid.      (2 marks)
Name _____

     (ii)      Write a balanced redox equation for this reaction.      (2 marks)

**Question 28** **(10 marks)**

Swimming pool maintenance uses sodium hypochlorite (NaCℓO), to control algae and bacteria. The swimming pool water can be considered as an equilibrium system as shown below, where hypochlorite ions are converted in to hypochlorous acid (HCℓO).

$$CℓO^-(aq) + H_3O^+(aq) \rightleftharpoons HCℓO(aq) + H_2O(ℓ) + heat$$

For best results, the concentration of the hypochlorous acid should be kept above 1.00 ppm.

(a)     Complete the table by using Le Châtelier's principle to predict, with reasoning, the effect of the following changes on the concentration of the hypochlorous acid (HCℓO) in the swimming pool.     (6 marks)

| Imposed change | Prediction for any change to the concentration of HCℓO | Brief reasoning for prediction |
|---|---|---|
| Increasing the pH of the pool | | |
| Increasing the temperature of the pool | | |

(b)     (i)     If the concentration is 1.50 ppm, calculate the mass of hypochlorous acid in a pool that has a capacity of 120 000 litres. (Assume 1.00 L of pool water has a mass of 1.00 kg)     (1 mark)

(ii)     Assuming 60% conversion of sodium hypochlorite to hypochlorous acid, calculate the mass of sodium hypochlorite that would be required provide this mass of hypochlorous acid.     (3 marks)

**See next page**

**Question 29**                                                                    **(5 marks)**

Biodiesel is a fuel that can be synthesised from natural oils and fats. The molecule below is a triglyceride present in vegetable oil that can be used for this process.

Biodiesel can be synthesised using a **strong base** to catalyse the reaction with methanol. The triglyceride breaks down into fatty acids and these undergo esterification with methanol to form methyl esters. The methyl esters are the main components of biodiesel.

(a)     State why the compound above is described as an unsaturated oil.          (1 mark)

_____

(b)     Draw the structural formula of the methyl ester formed from the section of the molecule circled in the above diagram.                                                              (1 mark)

(c)     Name a catalyst that can be used in this process.                          (1 mark)

_____

(d)     As well as the methyl esters (the biodiesel), there is one other product of this reaction. Name and draw the structural formula of this product.                          (2 marks)
Name _____

**Question 30** **(13 marks)**

The following reaction sequence can be used to synthesise ethyl ethanoate.

**STEP 1**

| Ethene |
| Steam |

*Phosphoric acid* →

| Ethanol |

*Concentrated sulfuric acid* →

| Ethyl ethanoate |

| Acetic (Ethanoic) acid |
**STEP 2**

(a) Phosphoric acid and sulfuric acid act as catalysts in this reaction sequence. Explain, using collision theory, how a catalyst speeds up a chemical reaction. (2 marks)

_____

_____

_____

_____

(b) Consider Step 1 and Step 2 in this reaction sequence.

  (i) Write the equation for Step 1 and name the type of reaction. (2 marks)

_____

_____

_____

_____

  (ii) Write the equation for Step 2 and name the type of reaction. (2 marks)

_____

_____

_____

_____

**See next page**

(c) In the first step, 458 kg of ethene was reacted with excess steam and 48.5 kg of ethanol was produced. Calculate the percentage yield of this reaction. (4 marks)

(d) Ethanol can also be produced using fermentation. Biomass provides glucose ($C_6H_{12}O_6$) which is fermented, producing ethanol and carbon dioxide as a by-product.

(i) Write a balanced equation showing the conversion of glucose to ethanol. (1 mark)

(ii) In this process, the reaction is catalysed by enzymes. Describe two characteristics of enzymes that make them different from catalysts such as phosphoric acid and sulfuric acid. (2 marks)

_____

_____

_____

_____

_____

_____

_____

_____

**See next page**

**Question 31** **(9 marks)**

Sodium stearate ($CH_3(CH_2)_{16}COONa$) is a soap.

(a) Using a diagram, and your knowledge of intermolecular forces, explain how the polarity of the stearate ion enables the soap to remove grease from a surface. (4 marks)

_____

_____

_____

_____

_____

_____

(b) In hard water, soaps can form a precipitate of calcium stearate (scum).

(i) Write an ionic equation, including state symbols, showing this process.

(3 marks)

(ii) Explain how the problems caused by the formation of scum can be overcome by using another type of surfactant. (2 marks)

_____

_____

_____

_____

_____

**See next page**

**This page has been left blank intentionally**

**Question 32**        **(7 marks)**

A group of students was investigating the equilibrium between dichromate and chromate ions. The equation for the system is shown below:

$$2\,CrO_4^{2-}(aq) \quad + \quad 2\,H^+(aq) \quad \rightleftharpoons \quad Cr_2O_7^{2-}(aq) \quad + \quad H_2O(\ell)$$

They started with 50.0 mL of a solution of 0.10 mol $L^{-1}$ potassium chromate, and gradually added hydrochloric acid to the solution. They recorded the colour of the solution and the pH using a pH meter. Their results are shown below.

Table 1. Colour of a solution of potassium chromate on addition of 1.0 mol $L^{-1}$ hydrochloric acid

| Measurement | Volume of HC$\ell$(aq) (mL) | pH | Colour of solution |
|:---:|:---:|:---:|:---:|
| 1 | 0.0 | 10 | green/yellow |
| 2 | 0.5 | 9.9 | green/yellow |
| 3 | 1.0 | 9.8 | green/yellow |
| 4 | 1.5 | 9.7 | green/yellow |
| 5 | 2.0 | 7.3 | yellow |
| 6 | 2.5 | 6.5 | orange |
| 7 | 3.0 | 4.5 | orange |
| 8 | 3.5 | 3.4 | orange |
| 9 | 4.0 | 2.1 | orange |

(a)      Plot a graph on the grid below showing the variation of pH against volume of hydrochloric acid added. *(a spare grid is provided at the end of the questions if required)*      (4 marks)
**See next page**

(b)     Suggest why there was no significant change in pH for the first four measurements.

(1 mark)

_____

_____

_____

_____

_____

(c)     Based on these results, the students concluded that potassium chromate could be used as an indicator in an acid-base titration. Evaluate this conclusion.                    (2 marks)

_____

_____

_____

_____

_____

_____

_____

_____

**See next page**

**Question 33** **(8 marks)**

Below is a representation of an electrochemical cell used to measure the standard reduction potential for the Ag/Ag$^+$ half-cell.

(a)     Give the half-equation for the reactions occurring at the anode and cathode and write an overall redox equation for the reaction occurring in the cell.          (3 marks)

| Anode half-equation: |
| --- |
| Cathode half-equation: |
| Overall equation: |

(b)     Use an arrow to show the movement of electrons in the external circuit on the diagram above.          (1 mark)

(c)     Explain why 1.0 mol L$^{-1}$ sulfuric acid is not used as the electrolyte in the hydrogen half-cell.          (2 marks)

_____

_____

_____

(d)     Apart from the concentrations of the solutions, state two other conditions required to achieve an accurate measurement of the standard reduction potential for the Ag$^+$/Ag half-cell.          (2 marks)

_____

_____

_____

**See next page**

**Question 34** **(7 marks)**

A student was investigating the equilibrium between the brown gas, nitrogen dioxide ($NO_2$) and the colourless gas dinitrogen tetroxide ($N_2O_4$). The gases were contained in a syringe. The syringe was suddenly squeezed to reduce the volume of the system. The temperature of the system was not changed. The equation for the equilibrium is shown below.

$$2\ NO_2(g) \rightleftharpoons N_2O_4(g) \quad \Delta H = -\ 57.2\ kJ\ mol^{-1}$$
(a)    Write the equilibrium constant expression for this reaction.    (1 mark)

K =

(b)    Complete the following graph to show what happens to the partial pressures of nitrogen dioxide and dinitrogen tetroxide as the syringe is squeezed and the system responds to the change by re-establishing equilibrium.    (3 marks)

(c)    Explain, with reference to reaction rates and collision theory, the shape of the graph drawn in part (b).    (3 marks)

_____

_____

_____

_____

_____

_____

**End of Section Two**

**See next page**

**Section Three: Extended answer**                                    **40% (80 marks)**

This section contains **five (5)** questions. You must answer **all** questions. Write your answers in the spaces provided.

Where questions require an explanation and/or description, marks are awarded for the relevant chemical content and also for coherence and clarity of expression. Lists or dot points are unlikely to gain full marks.

Final answers to calculations should be expressed to the appropriate number of significant figures.

Spare pages are included at the end of this booklet. They can be used for planning your responses and/or as additional space if required to continue an answer.

- Planning: If you use the spare pages for planning, indicate this clearly at the top of the page.
- Continuing an answer: If you need to use the space to continue an answer, indicate in the original answer space where the answer is continued, i.e. give the page number. Fill in the number of the question that you are continuing to answer at the top of the page.

Suggested working time: 70 minutes.

---

**Question 35**                                                      **(22 marks)**

Aspartic acid ($C_4H_7O_4N$) is a **diprotic** α-amino acid. Aspartic acid has solubility of 4.5 g $L^{-1}$ at 25 °C and a $K_a$ value of $1.26 \times 10^{-4}$. Aspartic acid increases resistance to fatigue and is often found in food supplements, especially those used by athletes and body builders.

A chemist was asked to analyse the contents of a food supplement to check the manufacturer's claims that it contained 97.0% aspartic acid by mass. To check this claim, the following experiment was carried out. (It can be assumed that aspartic acid is the only active ingredient in the supplement)

1. 1.546 g of the supplement powder was weighed and dissolved in warmed distilled water in a beaker.
2. The solution was transferred to a 500.0 mL volumetric flask and was made up to the mark with distilled water.
3. 25.00 mL aliquots of the resulting solution were titrated, using phenolphthalein indicator, against 0.0570 mol $L^{-1}$ sodium hydroxide solution.

**See next page**

The results obtained are shown below.

| Burette readings (mL) | Titrations | | | |
|---|---|---|---|---|
| | 1 | 2 | 3 | 4 |
| Final volume | 20.30 | 40.05 | 19.80 | 39.50 |
| Initial volume | 0.00 | 20.30 | 0.00 | 19.80 |
| Titration volume (titre) | | | | |

(a) Calculate the percentage purity of the supplement to **three** significant figures.

(c)   (i)   Due to the low solubility of the aspartic acid, it was suggested to the students that they use a 'back titration'. This would require the addition of a known amount of sodium hydroxide (in excess) to the aspartic acid and the titration of the unreacted hydroxide against a standard solution of acid.

Sodium hydroxide solution with a concentration of 0.978 mol L$^{-1}$ is used and there is a standard solution of 0.100 mol L$^{-1}$ hydrochloric acid available.

There are three pipettes to choose from (20.00 mL, 25.00 mL or 50.00 mL) for adding sodium hydroxide solution to the 1.546 g of the supplement powder.

Calculate which volume pipette the student should use to add the sodium hydroxide in order to get a titration volume (titre) of approximately 20 mL of the hydrochloric acid.                                             (7 marks)

(ii)   Explain why having a titre of less than 20 mL could increase the significance of the random error in this experiment.                         (2 marks)

**Question 36** **(11 marks)**

Proteins comprise up to 2000 α-amino acid molecules joined to form a polymer. The structure of 20 commonly occurring α-amino acids are given in your Data Booklet. The structure of proteins can be defined on a series of levels.

Compare the primary, secondary and tertiary structure of proteins by

(a)     drawing the primary structure of the section of a protein represented by:

– Gly – Ala –  Val –

(show all atoms in your diagram) (2 marks)

(b)     using a diagram to show how hydrogen bonding occurs between two parts of a protein molecule which contributes to the **secondary structure** of a protein. (3 marks)

 (c)     using diagrams to predict and explain the type of bonding which contribute to the **tertiary structure** of the protein that would be formed between the side groups of the following pairs of amino acids in proteins.

o  glutamic acid (Glu) and lysine (Lys)

o  leucine (Leu) and isoleucine (Ile)

o  cysteine (Cys) and cysteine (Cys) (6 marks)

**Question 37** **(19 marks)**

In Mount Isa, Queensland, one of the world's most productive mines produces lead, silver, zinc and copper ore. One of the minerals extracted at Mount Isa is chalcopyrite ($CuFeS_2$), and the reaction used to process this compound is shown below.

*Reaction 1*     $2\ CuFeS_2 + 3\ O_2 \rightarrow 2\ FeO + 2\ CuS + 2\ SO_2$

The copper-containing compound is then reacted with more oxygen as shown below:

*Reaction 2*     $CuS + O_2 \rightarrow Cu + SO_2$

There is also a sulfuric acid plant at Mount Isa, which collects, then cleans sulphur dioxide before converting it to sulfuric acid via the Contact process.

The Contact process includes the following exothermic reaction, which has a yield of 87.0%

*Reaction 3*     $2\ SO_2(g) + O_2(g) \rightleftharpoons 2\ SO_3(g)$
The conditions used in Reaction 3 are a moderately high temperature of 450 °C, a pressure close to normal atmospheric pressure and a catalyst of vanadium(V) oxide.

The sulfur trioxide produced is then added to sulfuric acid to produce oleum, which reacts with water to produce sulfuric acid with a purity of 98%. This two-stage process which can be summarized as:

*Reaction 4*     $SO_3(g) + H_2O(\ell) \rightarrow H_2SO_4(\ell)$
(a)     Assuming Reaction 1 and 2 are 100% efficient; calculate the mass of chalcopyrite required to produce 1.00 tonne of copper metal. (1.00 tonne = 1.00 x 10^6 g)                (3 marks)

(b)     Calculate the total number of moles of sulfur dioxide generated in the production of 1.00 tonne of copper.                                                                                (2 marks)

**See next page**

(c)     In 2012 the Mount Isa mine was producing 280 tonnes of copper per day from chalcopyrite and the sulfuric acid plant had to be closed down for maintenance and repair. Sulfur dioxide that would have been processed by the sulfuric acid plant was released to the atmosphere. Calculate the mass of sulfur dioxide in tonnes, released to the atmosphere each day during this time. (2 marks)

(d)     Calculate the mass of sulfur trioxide produced in Reaction 3 from 1.00 tonne of sulfur dioxide. (3 marks)

(e)     The sulfuric acid plant at Mount Isa has the capacity to produce 3,700 tonnes of 98% sulfuric acid per day. At full capacity, calculate the volume of water required by the sulfuric acid plant each day. (1.00 kg of water has a volume of 1.00 L) (5 marks)

(h) Explain, in terms of environmental chemistry,

   (i) two benefits of the two plants operating together at the same site in Mount Isa.

**Question 38** **(10 marks)**

Banana oil contains an ester which gives the oil its distinctive odour. A series of experiments were carried out to determine the formula of this ester, which was known to contain just carbon, hydrogen and oxygen.

1.51 g of the ester was combusted in excess oxygen and 3.57 g of carbon dioxide was produced.

A second sample weighing 2.11 g was combusted in excess oxygen and 2.04 g of water was produced.

(a)     Calculate the empirical formula of the ester.     (6 marks)

A third sample weighing 0.401 g was vaporised and the gas produced was found to occupy a volume of 162 mL at 150 °C at 67.0 kPa.

(b)     From this information, prove that the empirical formula of the ester is the same as the molecular formula. (3 marks)

_____

_____

_____

_____

_____

_____

_____

_____

(c)     The ester present in banana oil can be synthesised from an alcohol and a carboxylic acid. If the alcohol used was 3-methylbutan-1-ol, draw the structural formula of the ester.

(1 mark)

**Question 39** **(18 marks)**

Nylon is a polymer that can be made by reacting a diamine with a dicarboxylic organic acid.
It is a polymers whose molecular chains are formed by regularly spaced -CONH- amide groups.
Making nylon is even easier if you use a diamine and a diacid chloride instead of a dicarboxylic acid.
This is because acid chlorides are much more reactive than carboxylic acids.

The reactants that can be used to make nylon are shown below.

1,6 - diaminohexane

and

decadioyl chloride

(a) Write an equation for the reaction that would occur when **two** of these monomers reacted. You can use the abbreviation $(CH_2)_4$ when writing out the equation.
(2 marks)

(b) Draw a section of the polymer, commencing the 1,6 - diaminohexane that has three **(3)** repeating units in its structure. You can use the abbreviation $(CH_2)_4$ when drawing the backbones of either of the monomers.

(2 marks)

**See next page**

(c) The reaction that forms nylon occurs at the interface of two solutions made from solvents of differing polarities as shown in the diagram below. Nylon is a polymer you can make yourself in the lab. A strand of nylon fiber can be pulled from the interface between two liquid phases.

**Two liquid phases**

one liquid phase ⟶

another liquid phase

Considering the structures of the two monomers involved in this reaction describe the nature of the two solvents used to dissolve the monomers and explain why that particular solvent would have been chosen for that monomer.

_____

_____

_____

_____

_____

_____

_____

_____

(4 marks)

(d) Nylon can be used to manufacturea high strength fibre that can be used for making fishing nets, ropes or fabrics in textile industry. The strength of the intermolecular forces between the polymer chains is the reason that nylon can make such strong fibres.

Using the same structure you have drawn in (b), draw two stands of the polymer to show the intermolecular forces that exist between the polymer chains. On your diagram name the type of intermolecular force.

(3 marks)

**See next page**

(e)      Polytetrafluorethene (PTFE) is another polymer that is in common use but unlike nylon it can be used to store reactive and corrosive chemicals.

Write about 1 page addressing the following points. The answer has to be written in paragraphs and full marks will not be allocated to answers that include dot points.

- Compare the polymerisation processes used in the production of nylon and Polytetrafluorethene. Include a balanced chemical equation showing the formation of polytetrafluorethene.
- Use the structure of the polymer to explain why surfaces coated with Polytetrafluorethene slide over each other very easily. i.e. they have low coefficients of friction.
- State two properties that PTFE and polyethylene (PE) have in common.
